HATS OFF TO LOS ANGELES AIRWAYS TO THE U. S. POST OFFICE

In cooperation with the U. S. Post Office, Los Angeles Airways has completed a full year of pioneering in carrying the mail by helicopter. A few figures indicate how eminently successful the operation has been.

	Oct. 1947	Sept. 1948	Increase	Total
Pounds carried	48,100	272,981	468%	1,510,670
Revenue miles flown	9,853	26,465	169%	237,474

In performance of this task, rugged Sikorsky helicopters, the only ones used, have amassed a total of more than 4,000 trouble-free hours in the air. The operation, having carried the equivalent of 95,000,000 letters and saved an estimated 47,500,000 letter days, has proved its worth to the Post Office, to Los Angeles Airways, to the people being served—and to Sikorsky Aircraft.

An ATTITUDE and an APTITUDE
that built a 17-acre plant

There is a "success story" . . . yours as well as ours. You practically inched on Fafar's success by designing into your newball shock new requirements for ball bearings. So did manufacturers in other industries. But it took something more than mere multiplication of work forces and machines to build that new approach to ball bearings into a 17-acre plant. Fafar calls this something an attitude and an aptitude . . . a way of looking at ball bearings from where you're sitting . . . and an aptitude for doing just what you'd like done about it.

A job done is just the beginning
of a job to do.

Each new achievement in aircraft ball bearings serves as the takeoff for still another advance. For instance, Fairbairn designed Hs-Ball Bearings to withstand desert heat and sand, airport dust, polar cold, snow and rain, pressure strains, cleaning, salt spray and almost everything else. Then designers set up additional requirements. To use synthetic greases. To conform to NAS specifications. Such design progress requires that Fairbairn engineers work unobtrusively with industry research men and designers.

Ideas are contentious

One problem's solution suggests the answer to still another question. That's how *Falcar* leads to major developments of ball bearings for aircraft. The *Falcar* Bearing Company, New Britain, Conn.

NEWS SIDELIGHTS

Smoothing Airways

Members of the newly created Air Navigation Development Board meet quietly in New York last week with key members of the aviation committee of the National Military Establishment research and development board to area out policy matters and define more specifically areas where the NMDB charter is not sufficiently specific.

Key to swift and use development of the intricate target system of all-weather electronic aircraft will be two effectively ANDR systems along with the two other interrelated government groups involved—the RDB navigation committee and the Air Coordinating Committee's navigation panel.

Economy Axe

The committee was joined over the Air Transport Association this month on 1 of the paper-maché matters turned out to be the one last year. A first rate subcommittee of ATA's former committee has given the association's disquieting a thorough going-over and last week made its report.

Airline board slashes up to 30 percent may be approved by ATA's board of directors, which holds its annual meeting Dec. 16. The association's executive committee, long a target of congressmen, may not be relaxed. Some airline executives who lack marketing economies are fearful that wholesale budget slashes will do permanent harm to the industry when it is showing signs of getting back on its feet.

Airline Investigation

Conrad Wilkins Raper and several counsel Francis Thurgood of the Senate investigating subcommittee are ready to open public hearings on airline administration in some as-used if subcommittee chairman, Sen. Homer Ferguson (R., Mich.), is not Democratic reaction to the chairmanship in January, push the button.

Ferguson has not given a definite "no" to the hearings, but it appears probable that he will launch them during his brief remaining tenure in the chairmanship which will end Jan. 7. Sen. John McClellan (D., Ariz.) who turned Democrat in the election is in line to take over the chairmanship of the full Senate Committee on Transportation and Interstate Commerce, of which it is a subcommittee.

McClellan is known in aviation circles

Lobbying Prospects

A preliminary up of lobbying regulations appears likely at the new Democratic-controlled Congress. Apparently, two dozen aviation representatives—mostly from the active field—lost registered under the lobby provisions of the 1946 Congressional Reorganization Act.

During the election campaign, Democratic chairman Sen. Howard McGrath (D., R. I.), proposed legislation regarding the lobby provisions of the 1946 Congressional Reorganization Act. McGrath suggested, would enable legislation to limit the spotlight on lobby activities while legislation was under consideration—rather than after.

Consideration of McGrath's proposal may be preceded in the new Congress by an investigation of lobby activities over the past two years of the 80th Republican-controlled Congress. Justice Department is now limited to prosecuting for failure to register under the 1946 act.

for his backing of the clean instrument policy as a member of the old Senate Commerce Committee. He is viewed as a Pan American Airlines partisan by some airline spokesmen. Senate Democrats, however, plan to nominate McClellan a director. In the case, the chairmanship—and the decision on holding active industry hearings after here are—would fall to Sen. Clyde Hay (D., N. C.), a Southerner who stuck to the Democratic fold in the election.

Five-Hour Air Show

An elaborate air show will not, in spite of attention with a five-hour parade from the Capitol, draw President Truman to the White House at the Presidential inauguration ceremony. Air Force, Navy, Marine, and Coast Guard planes will participate in the air demonstration.

It will feature the services' newest type planes, including B-50, and tactical formations. If the air program falls short of the estimated five hours of the inaugural parade, there will be a repeat performance. Show was Carter Brown, eastern manager of Lee's Aviation and Washington representative of NCM, as

handling air show arrangements for the inaugural ceremony headed by Melvin Hollander.

Air Force Fight

Defense Secretary James Foran's latest move to put the Air Force—on order regarding that all personal inquiries of the three services found through his office before submission to Congress—won't stop the Air Force legislative program.

Objective of the Foran's legislation was to lift off legislation authorizing the 70-Congress USAF before it could reach Capitol Hill. But it's already set to come up despite the ploy.

Rep. Carl Vinson (D., Ga.), scheduled to become chairman of the House Armed Services Committee, is ready to start it through his committee and the House—both of which occasionally opposed it in the last Congress. In the last Congress Senate armed services committee latched receptively to Foran's arguments and performed action on the measure.

New vice, Sen. Edwin Johnson (D., Colo.), scheduled to become chairman of the Senate Interstate and Foreign Commerce Committee, and Sen. Owen Brewster (R., Me.), outgoing chairman of Interstate and Commerce subcommittee, will promote Senate armed services for favorable action. Their cue will be the 70 Congress program is not only vital for an adequate defense force, but also necessary to keep an adequate aircraft manufacturing industry in being—a subject of concern to the Interstate Commerce Committee.

Produce-Engine Problem

Aircraft engine and propeller manufacturers are not as prone to "go along" with the Air Force's new "produce-or-buy" factor as in the case of engine manufacturers. Holding strongly to the view that engines and propellers are "discrete" devices, as compared with "inter" nature of airplanes, these manufacturers are convinced that engines and propellers undergo far less extensive redesign during the development stage to permit any consideration of producibility in the process.

They believe that as through the development stage, performance should be the criterion for evaluation and after the engine, as propeller has evolved the flight stage that then consideration can be given to producibility.

are you probing THE UNKNOWN?

Are you faced with probing problems beyond the scope of present experience? We have long sensed that an extensive program of research and investigation is vital, in order to make an effective contribution to the progress and development of the aviation industry. Pacific-Western technicians, backed by the knowledge gained in over a half century operation of our company, are continuously engaged in extending known practices and designs by such programs. They have available constant up-to-date knowledge on the subject of mechanical power transmission based on actual experience. You will find them taking important roles in nearly every major development in the aviation industry.

Let us demonstrate what we can do to help you solve your mechanical power transmission problems. Contact us now!

Write us your company information for your copy of the new Pacific Western Gearbook Equipment Catalog.

The Birdmen's Perch

By Major Al Williams, ALIAS, "TATTERED WING TIPS,"

Gulf Aviation Products Manager, Gulf Bldg., Pittsburgh 30, Pa.

'I would like to see 15 feet!'

That's the story we want to hear! We want to know what the fellow in the light plane thought when that rear wheel of his last one had his plane get the tailwheel of the P-60.

If you know him—he are last—will you get in touch with us, please?

PUMPS AND CIRCUMSTANCES

The new developments in engine case so rapidly that we have trouble keeping up with them.

A new fuel pump for your pump a barrel of fuel in 75 seconds at pressures as high as 750 lbs. P.S.I. That's 5 times the amount of fuel in 15 minutes the previous fuel pumps had to deliver on engine in use during World War II!

We should be interested! The improvements in fuel pumps in the last few years are no longer than the improvements in lubrication, a subject with which we have a common tendency.

GulfBldg.—Senior D, the amazing one oil for homecoming engineering men, then

meant by drawing.

GulfBldg.—Senior D, is the only oil in the world made specifically for lightplane engines which has had the Alkali Fuel test even more rigorous than it.

Try it, and watch your repair and replacement bills drop.

We've only room for one Little Known Fact About: GulfBldg.—Senior D, is the only oil in the world made specifically for lightplane engines which has had the Alkali Fuel test even more rigorous than it.

"The pressure at 1500 psi is 200 pounds per inch and is an experimental test."

A more, Dile and we'll promote you to Senior Fuel Pilot, a rank so exalted that every man knows when they see it!

And how about the test oil? Haven't you got your aviation information?

Send it to the address in the top of the page and get the Consumption the real Fuel Pilot use!

... TOUGH, DEPENDABLE,
and widely used

Reg. U. S. Pat. Off.

SOCKET SCREW PRODUCTS

The "Unbraiko" Internal Wrenching Bolt (A) and the Triad Head Socket Bolt (B) are practically "nuts" in the Aviation Field — they so exactly meet the requirements of precision, tensile torque and other stringent requisites of Aviation Engineering. And the other popularly acclaimed "Unbraiko" Products, pictured to the right, have proved themselves throughout industry for years as absolutely dependable.

Write us for the name and address of your nearest "Unbraiko" Industrial Distributor and for your copy of the "Unbraiko" Catalog.

"UNBRAKO"
SOCKET SET
SCREW WITH
KNURLED CUP
POINT

"WON'T SHAKE LOOSE"
The Triad Head Socket Bolt of the Unbraiko series is a self locking, self-tightening bolt that will not come loose without the use of the most powerful wrench.

"UNBRAKO"
SOCKET SET
SCREW WITH
KNURLED THREADS

"WON'T SHAKE LOOSE"
The knurled threads make this set of self-tightening, self-locking bolts and nuts that will not come loose without the use of the most powerful wrench.

"UNBRAKO"
KNURLED SOCKET
HELD CAP SCREW

"WON'T SHAKE LOOSE"
The knurled threads make this set of self-tightening, self-locking bolts and nuts that will not come loose without the use of the most powerful wrench.

FLEX-LOG

ONE-PIECE
SELF-LOCKING NUTS
"WON'T SHAKE LOOSE"

Because it is a complete, one-piece, self-locking nut, it is rugged, "flexible" and all in one—designed to have an exceptionally uniform tensile and long life. The "Flex-Log" is becoming widely accepted. Request samples.

The knurled head of the Unbraiko series is a self locking, self-tightening bolt that will not come loose without the use of the most powerful wrench.

"WON'T SHAKE LOOSE"
The knurled threads make this set of self-tightening, self-locking bolts and nuts that will not come loose without the use of the most powerful wrench.

"WON'T SHAKE LOOSE"
The knurled threads make this set of self-tightening, self-locking bolts and nuts that will not come loose without the use of the most powerful wrench.

"WON'T SHAKE LOOSE"
The knurled threads make this set of self-tightening, self-locking bolts and nuts that will not come loose without the use of the most powerful wrench.

NEWS DIGEST

CUT IN CAA SAFETY STAFF

Shaken of nearly 50 percent in Washington last week, the Civil Aeronautics Administration (CAA) is expected to announce that it will place further cuts in its staff. The administration will place further cuts in its staff. The administration will place further cuts in its staff.

CAA is expected to announce that it will place further cuts in its staff. The administration will place further cuts in its staff. The administration will place further cuts in its staff.

DOMESTIC

William A. Blevins, vice president of Consolidated Vultee Aircraft Corp., was appointed vice president of Aero Mfg. Corp. and general sales manager of Aero Mfg. Corp. He had been with Aero Mfg. since 1945.

Screw thread standardization agreement was signed at Bureau of Standards in Washington by U. S., Great Britain and Canada.

Railway Express Agency last week was scheduled to inaugurate new Air Express service to Honolulu from Seattle, Portland and Tacoma via Northwest Airlines.

FINANCIAL

Glenn L. Martin Co. reported sales totaling \$15,171,046 in quarter ending Sept. 30, bringing sales for first nine months to \$41,939,374. In prior year, sales were \$15,420,120.

Fairchild Engine & Airplane Corp. declared dividend of 26 cents per share, payable Dec. 27 to holders of record Dec. 7. Company announced backlog of 380 engines.

INDUSTRY OBSERVER

Watch for the Navy to come up with some long distance flights to demonstrate increased range of carrier based planes as each all important land target in the world with a 3000-mile radius of action. Navy is sensitive to criticism that it does not now have any planes capable of putting them to rest. Most likely candidates for the range demonstrations appear to be the Douglas Skyraider (SAD-1) which has a 2500-mile range and the McDonnell Banshee (F2H-1). Both planes will probably be launched from a carrier in the Pacific and landed aboard a carrier off the Atlantic coast.

Air Force has conferred redesignation of the North American F-56C to the F-53A due to the extensive structural, mechanical and equipment changes which made the new model virtually a new airplane. As reported in AVIATION WEEK, Sept. 27, 1948, the new model will have vastly superior performance and possibly be added power from the General Electric turbojet engine, development on which has extended its output to the 1000 h. static thrust rating. The new model will also incorporate changes in the use of production and surplus aircraft. Air Force has 118 F-53A models on order.

Navy Douglas D-558-II Skyrocket has exceeded sonic speed in shallow dives using only the 3000-hp. Pratt & Whitney 24C turbojet engine in power. Tests to date have concluded that the risk of the wing breaking through the transonic zone using only jet power. To reduce the drag created by the flattened air flowing over the four rocket nozzles a streamlined firing cone has been installed. The Skyrocket now is being modified for rocket powered supersonic flight tests, which are expected to exceed the performance of the Air Force Bell X-1 by a substantial margin. D-558-II is designed to attain Mach number 3.4 for research tests and is theoretically capable of Mach number 3.75 (1323 mph at high altitude).

Conversion of the nine remaining Northrop YB-35 piston-engine Flying Wing bombers to turbojet engine installations will not arise from YB-35. The new airplanes will be designated RB-35B and will require a modification to a basic airplane, rather than an existing one. One of the remaining nine airplanes will not be equipped but will be used as a static test ship. Northrop also plans assembly of the first production RB-49A at its Hawthorne, Calif., plant with the remaining 24 being produced at General's Fort Worth division. Northrop participated in the General program to be awarded the design of the new aircraft, original project engineer on the Flying Wing bomber program.

General began delivery of the B-36B to the Air Force at General's Field, Fort Worth on Thanksgiving Day and expects to have all of the new model long range bombers delivered to the Air Force by the end of November. General's Field ramp and parking space is being enlarged to handle the new model B-36B and the 11th Bomb Group which will become the second Air Force group to be equipped with the 10,000 mile bomber. General is making one B-36B per week out of its Fort Worth plant.

Boeing Air Force is using Boeing Bomarcas and Republic Sabreurs in its bombing operations against the Arabs. Equipped for tactical operations, the Bomarcas carries two 500 lb. bombs and the Sabreurs carry a 500 lb. bomb and a 100 lb. bomb. The Sabreurs are also equipped with 100 lb. bombs carried externally under the wings. The Sabreurs can also withstand a dose with 100 lb. bombs tossed through the open hatch.

Commonwealth Aircraft Corp. of Australia will soon begin a production program on latest British jet types. CAC is now scheduled to build 50 B-160s. CAC is currently designed as a following-up New Zealand aircraft. CAC is now under a five year contract with the Australian Government of aircraft production is also scheduled to build 50 of a new British jet bomber design. Both the bomber and fighter will be equipped with 5000 h. thrust engines which CAC is looking up to build in Australia.

Four airborne equipment racks for the common system interim program.

What All-Weather Airways System Needs

CAA gives first demonstration of air and ground devices used in interim program.

By Robert Hotz

INDIANAPOLIS—First peek at how the electronic, all-weather airway system (Aviation Week, Mar. 3) operates was offered here by the Radio Technical Commission for Aeronautics.

Equipment to be used in the interim period of all-weather airway development (Aviation Week, Mar. 22 and Sept. 6) was exhibited by RTCA in a two-month series of flight and ground demonstrations at the Civil Aeronautics Administration's experimental station, at Waukegan, Ill. The RTCA demonstrations are intended as a preliminary report to acquaint future users with the equipment, bolster appropriations requests to Congress for funds to supplement the billion-dollar program, and to gather support for the program in the International Civil Aviation Organization conferences on standardization of navigation and traffic control procedures.

► **Revised Announcement**—Budgetary areas at the demonstration were CAA Admin-

istrator Delta W. Kentz's announcement that the very high frequency (VHF) radio beam landing system (ILS), which has been in ground use since last spring.

Kentz said CAA now has 275 of its planned 600 arrangements in commission with installments going at the rate of 50 new stations per month. First delivery of airborne receivers to one instrument ground station have already been made to the airlines. Initial deliveries of lightweight VHF omni-range receivers for private pilot use are expected next February. Revised estimates that by next July 400 omni-range stations would be in commission and some 700 airborne receivers will have been delivered to the airlines by Collins Radio Corp.

► **RTCA Program**—Production specifications for delivery and testing equipment

(DME), the next major component in the schedule are now in process of being written by a special committee of the RTCA. Target date for complete operation of the interim system is still 1972.

Kentz estimated total cost of the interim system at \$775 million. Another \$735 million will be required to develop and install the target system by 1962. The target system will be almost entirely automatic with human controllers operating largely in a supervisory capacity.

► **Cost Breakdown**—CAA technical experts advised following on the cost of equipping a single airport for interim system operations:

Omni-range ground station	\$45,000
DME ground station	16,000
ILS radio beam landing system	125,000
Traffic control radar	103,000
Precision beam landing radar	97,000
Slope beam approach lights	30,000

Total
Airborne equipment to use these installations will cost the airlines about \$12,000 per plane plus \$3000 installation cost.

Details of airborne equipment costs: Omni-range and VHF radio re-
ceiver \$1,000

Services provided from the ground by the common system interim program.

DME receiver \$12,000
Airborne off-course computer \$12,000
All airborne equipment is covered in duplicate for safety purposes, thus doubling the cost of each device.

► **Missing Links**—Major items still missing from the interim system are airborne radar transponders and private line voice communications system. Radar transponders will be used for automatic aircraft identification as radar sweeps and automatic transmission of altitude, course and distance for traffic control purposes. The private line voice communications system will carry all routine traffic control information to and from the ground to leave the now badly overcrowded voice channels free for emergency and special communications.

Most of the immediate effort of the Air Navigation Development Board (Aviation Week, Mar. 22) research program will be devoted to developing these two items. Both are required for the target system as well as the interim program.

► **Progress Highlights**—Here are highlights on the current status of interim equipment deployed and tested at Indianapolis.

► **Omni-Range**—Major effort on that project is still aimed at improving accuracy of the beams transmitted by the ground station. CAA now requires stations of plus or minus two degrees. Airlines particularly would like to see

improvement in this dimension. CAA is now experimenting with wind, plastic, antenna bending, clock clock shielding, and rotating antennas in an effort to improve the accuracy of omni bearings. Since the omni-range operates as line-of-sight, human interference must be avoided and strong stations as a major problem.

Airborne omni-range receivers for military and airline use are being manufactured by Collins Radio Corp. Four types of lightweight VHF omni-range receivers were shown at Indianapolis. These were made by National Aero-

space Corp. of Ann Arbor, Pa.; Lear Inc., Grand Rapids, Aircraft Radio Corp. of Houston, N. J. and Charles Banks of Ann Arbor, Mich. Inc., Waukegan, Ill. Cost ranges from \$1500 down to \$230 for production models in quantities of 10,000. These lightweight VHF receivers were installed in a Beech Bonanza, TEMCO Buell and Piper Super Cubes, where they are tested under considerable flight testing. Production models of several kinds are expected to be on the market early next spring.

► **DME**—DME is rapidly passing out of the development stage into production. Two types of DME equipment have been developed by Federal Telecommunications Laboratories, Natick, N. J., and the Heathcote Electronics Corp., Little Neck, N. Y. Both control major military research contracts with

development models given to CAA for operational testing. Both types of equipment use line-of-sight as the basic transmission path from plane to ground and return to give linear distance of a plane from the ground station.

However, they handle differently the problem posed by the relatively limited frequency spectrum available for this service. Federal uses narrow frequency bands with precise crystal tuning to get the required number of channels. Heathcote uses broader frequency bands with each band divided into several coded channels. The Heathcote system requires tuning for both frequency and codes.

Indianapolis currently has the early DME ground station that is operational. DME antennas are mounted on top of the omni-range buildings and in most cases the DME equipment will be installed on omni-range sites. Some installation has been given to additional DME stations as instrument landing receivers to give pilots an exact amount of their distance from touch down.

DME cockpit installation now is several types of aircraft-type dials which read distance to the ground stations as lead wires. These are installed for ranging up to 120 miles to a station and 30 miles overhead. Airborne DME equipment weighs 45 lb. with no light weight DME receivers yet in prospect.

for amount of potential type strength. ■ **Automatic Composites**—1000. Type of interference of more compact, less distributed. One was an experimental model developed by CAA. The other, manufactured by Minneapolis Honeywell and by Collins Radio Corp. Logical of the two now reaches 10 ft, but by eliminating duplicate equipment already contained in some-type and DME systems, production models can be cut to 12 ft. The development model computers have been thoroughly flight tested and give a good account of themselves during flight tests on the Indianapolis overrange and DME stations in instrument weather. They should appear in production models soon.

■ **Traffic Control Radar**—CAA is considerably behind aerial development of radar for traffic control purposes. CAA has nothing comparable to the military CPN-15 traffic control radar now being built in quantity by the Radio Division at Beltsville. CAA is just beginning use of the moving target indicator in electronic ground station from previous studies. Progress is under way using Thru-Beam lenses and special Control Mode under control scope. In get a real slope that can easily be used under daylight conditions and does not require a dedicated room.

■ **ILS**—Experiments are continuing to verify accuracy of ILS glide path and broadcast signals. A third glide path has been developed that follows out at an altitude of 50 ft and follows more as outside the surface of a normal aircraft approach. Previous design, which was a straight line. Advantage for the third glide path are mounted on a 16 ft pole that puts them well above interference from ground traffic that now is rising on the old glide path. Plans for the CAA has also been a new indicator shall around as ILS beacons to aerial reference from radio beacon and telephone wires that produced as many as 11 false beacon signals and beacons in the same area. The problem is we shall locate work like the wire came around house like a baseball diamond and has been successful in eliminating much of the interference with the beacon. Studies have not yet been made to determine whether the wind velocity the lock comes of the beacon.

Three models of automatic approach control equipment made by Honeywell, Bendix and Sperry for their respective military use. The studies are in intensive background as the ILS system. ■ **Precision Beam Radar**—CAA led no late models of this equipment to evaluate. Other models were demonstrated earlier in a seminar for ILS approaches. Although all agree that the new models, others will use this type of radar as they proceed toward it.

Piper-Stinson

Deal involves reported \$3 million; merges two of top names in field.

Piper Aircraft Corp. moved quickly last week to take over its new partner, the Stinson division of Consolidated Vultee Aircraft Corp., at Montreal, Quebec, Canada. The deal was announced by Piper Aircraft Corp., at Montreal, Quebec, Canada. The deal was announced by Piper Aircraft Corp., at Montreal, Quebec, Canada.

Terms of the transaction, not officially reported at a figure of nearly \$3,000,000. These new industries that only a small part of the transaction was a cash, and that a stock transaction and a new partnership agreement covered the balance.

■ **President's Comments**—William J. Piper, president of the company bearing his name, and Floyd B. Gifford, General president, declared the transaction was an advantage to both companies as well as to the personal plane industry. Piper told Aviation News from Lock Haven, Pa., that a shareholders' meeting would be called about Jan. 15 to determine whether the issue of the company would be changed to Piper-Stinson Aircraft Corp.

Representatives of the Piper organization went to Detroit last week for a fly-out of 30 new Stinson four-place planes from William Piper Airport. A total of 575 Voyager 155s and Flying Stag 155s are stored there and are included in the purchase. On a basis of the last reported three, the price of \$6444 for the Voyager. Three airplanes alone would have a retail value of nearly \$2,500,000. In addition, Piper obtains the Stinson parts inventory, tooling and all equipment except the physical plant itself.

■ **Production Plans**—Plans will be initiated from William Piper for the present, while tooling and fixtures will be moved to Lock Haven in months if possible. It is expected Piper will be ready to begin production of Voyagers at Lock Haven by the time the Piper stock of planes is depleted. When a new prototype of a new higher horsepower model of the Voyager which has been doing the same time and is now at San Diego will be received in the warehouse and will be built later at Lock Haven, Piper said.

The biggest transaction in the personal plane industry since Ryan's purchase of the North American airplane plant at Van Nuys was viewed by qualified industry observers as a constructive step. It brings together two of the oldest and strongest names in the private jet aircraft manufacturing field. Stinson has been making airplanes since 1925 in the same company with Piper, now associated with C. G. Taylor in building the early Taylor-Guth lightplane

established his own company in the early 1930s at Bradford, Pa., and moved about four years later to Lock Haven.

■ **Consolidated Models**—Piper and his company would continue to make its present models including the two-engine biplanes, Family Cruiser at least for the present, and "would let the customers decide whether there was a sufficient market for both biplanes."

Directly affected will be the owner of nearly 1000 Stinsons which have been sold since the end of World War II, who are now worried of a continuing maintenance source for spare parts and accessories.

■ **Dealer Ship**—The Stinson dealer organization will be coordinated with the Piper dealer organization as soon as possible, or possible although there will eventually be problems of combining and overlapping franchises, Piper said.

The Voyager acquisition gives Piper a complete line of planes, from the small 65-hp to airplanes up to the Voyagers. Since the Stinsons resemble the Piper products, use of dual tube and fabric construction, no major problems of engine shifts, tools or materials are anticipated in fitting on the Stinson production.

Alford pointed out that the transaction integrated two non-competing lines into a single manufacturing and sales organization with concurrent line production and expanding operations and additional volume for individual dealers. He said that CAA's facilities and commercial plane production schedules make it more difficult for the management to coordinate the two lines.

For Stinson, Stinson sales manager and CAA Stinson division sales manager will be asked to use the Piper sales organization under the new setup.

AIA to Choose New President

Schedule of a new president of Aircraft Industries Assn. to succeed May Geo. Oliver F. Nichols (ret.) was the principal topic on the agenda of the AIA Board of Governors meeting scheduled Dec. 4 at Newmarket Hotel Springs, Calif.

Reports in advance of the meeting were that the nominating committee headed by E. F. Wilson, chairman of the board, was having difficulty in narrowing the long list of suggested candidates. The name was viewed by qualified industry observers as a constructive step. It brings together two of the oldest and strongest names in the private jet aircraft manufacturing field.

Stinson has been making airplanes since 1925 in the same company with Piper, now associated with C. G. Taylor in building the early Taylor-Guth lightplane

— lights being shown by system developer H. J. Carr (right) and J. Carr (left)

Slope Line Light Approval Near

Panel recommends that new system become approach standard for both military and civil plane use.

The slope line light system, approach light system was headed toward rapid adoption as the new post-war standard approach light standard last week.

Approach Lighting Association Panel indicated informally they will approve the ALEP recommendations. The ALEP subcommittee will refer the proposal to its specifications group which will draw up detailed specifications for the new approach light system. Civil Aeronautics Administration now has \$524,000 available out of its fiscal

1949 budget to buy approach lights. The slope line system costs an estimated \$50,000 per installation including installation only. CAA also revealed that it had used fiscal 1949 funds to purchase the approach lights at 10,000 ft. N.Y. from the New York Port Authority and the American Civil Aeronautics Administration test installation at Newark which was later moved to Santa, Calif. Two ALEP single use, red approach lights now have been purchased out of fiscal 1949 funds (Aviation Week, Mar. 24).

■ **CAA System**—The slope line system was developed by a group of CAA lighting engineers headed by H. J. Carr, Peoria, who also had a voting member day on ALEP and was chairman of the steering committee, which supervised the procedures at the Landing, Air Traffic Control Station at Andrews. Peoria was also named for membership on an engineers' panel that will review all future lighting systems offered for test.

Slope line system consists of a flexible line of lighting vanes extending outward in a fan-like 1800 ft. from the end of the runway. Each individual vane consists of 10 2 1/2 ft. vanes and is mounted on a base which is mounted by General Electric Co. and mounted on a 15 ft. long base.

■ **Glide Angle**—The units are installed at a 4.5 deg. angle to the ground. Intersections of the slope lines on each side of the installation are supposed to provide a visual glide path to aid pilots making approaches in poor visibility. When viewed on course the slope line lights merge into a continuous line of lights extending to the runway threshold. On approaches where an aircraft is not properly aligned with the runway the slope line lights indicate the correction required.

First two experimental installations at

How Boeing Spreads Its Work

Just how Boeing Airplane Co. intends to meet the industry's greatest bugaboo, production schedule is graphically illustrated by these two charts.

P. L. Ladd, Boeing vice president manufacturing, says that so single aircraft manufacturer could undertake a large program for the Air Force without losing the help of other aircraft manufacturers as well as of other industries. Although Boeing is doing all final assembly in the four airplanes in its Seattle and Wichita plants, the subcontracting program is the largest undertaking

in point, and before it is finished might exceed the extent of the wartime B-29 subcontracting set-up.

Dollar Allocation—Of every dollar paid by the Air Force to Boeing for the B-52, B-54, B-56, B-57A and B-57B, the company has a little more than 40 cents to cover its own costs. The major part of the remainder (54 cents) goes to the subcontractors, with 10 cents being spent for parts and 7 cents paid out to suppliers of raw material.

Some of the companies furnishing

parts for the four planes: Bendix Aviation Corp., Cleveland; Phoenix Tool Co., Topeka; Inco Gear and Machine Co., Los Angeles; Manufacturing Co., General Mfg. Inc., and Goodrich Aircraft Corp.

Subcontractors—In the subcontracting program as the backbone of aircraft manufacturing as well as some of the smaller companies. Consolidated Aircraft Corp., Douglas Aircraft Co. (which has just announced a new \$5,500,000 order for 200 16-ft. fuselage sections of the B-56), Consolidated Vultee Aircraft Corp., Northrup Aircraft, Inc., Kaiser Aircraft Corp., Ryan Aircraft Co., and Southern Aircraft Co.

The exploded view of the B-56, below, shows the extent of the subcontracting on this airplane alone. Circled numbers are the company's airplane section numbers. The members following the subcontractors' names indicate the airplanes which receive those parts. For example, the components built by Convair will go into the 216th B-56 and those that follow.

PRODUCTION BRIEFS

Consolidated Aircraft Engineering Corp., Bellingham, N. Y., has completed the last production B-56. Navy jet fighter. Production of more than 400 B-56s will continue at about one a day.

Westinghouse Electric Corp. has closed production of the J-38 (28) jet engine at its South Philadelphia plant. Total of 20 J-38s were built. 118 by Pratt & Whitney Aircraft Division of United Aircraft Corp., South Plainfield, plus continuous production of the J-37 (24).

Pratt & Whitney Corp., Meriden, Pa., has completed the production of the engine to improve performance. A new production manager, W. C. Miles, has been appointed, in addition to a production manager, Walter V. Tadous. Company is working to increase its engineering staff from 150 to about 200.

General Electric Co. has opened a new \$1,000,000 motor manufacturing plant at Sta. Jose, Calif. The 144,000 sq. ft. factory eventually will produce 25 GE turbojet engines a month. At peak production early next year, output is expected to be 1500 1 to 100 hp. motor a week.

Teas Engineering & Mfg. Co., Dallas, has received contracts to plan and build the Air Force and Navy automatic radio beacon light designed by W. R. Lightbody, Inc., of New York. The new type beacon, known as "Flash-Air," also will be available for personal planes.

On 4x4 U.S. military to transport C-54s used on the Berlin airlift, TEMCO expects this month to reach a rate of 25 per month.

IS YOUR PLANE WORKING THIS WINTER?

Here's how Navion stays on the job all year 'round . . .

CHRISTMAS TREE BIRD OPERATES AT SEASON'S PEAK WITH A RYAN NAVION

Way E. Hildreth of Detroit, Mich., leading shipper of Christmas trees, says: "My Navion's smoking winter performance means I don't have to slow down during this important season. Navion's bulky tractor gear, high ground and propeller clearance get me in and out of rough, snow-busted fields with ease and safety."

ALASKAN RUSH PILOT STAYS ON SCHEDULE WITH A NAVION

Robert E. Hildreth, "Captain of the Air," says: "My Navion's quick starting, deep snow take off, and high ground clearance get me in and out of rough, snow-busted fields with ease and safety."

IGARD HINE OPERATOR PROFITS FROM NAVION'S WINTER DEPENDABILITY

Bob Clarken, engineer, "Navion's" owner, says: "My Navion's quick starting, deep snow take off, and high ground clearance get me in and out of rough, snow-busted fields with ease and safety."

COMPARE THE RYAN NAVION'S ALL-YEAR PERFORMANCE FEATURES

Check this combination of features that makes the Ryan Navion unique in all-year dependability and performance.

- Heavy-duty and well-ventilated engine for short-stroke comfort in sub-zero weather.
- Heavy-duty landing gear and take off of any plane in its class.
- 100% radio reliability, especially in inclement weather.
- Thick ground-clearing propeller.
- Heavy-duty landing gear and take off of any plane in its class.
- 100% radio reliability, especially in inclement weather.

If you'd like your own business to grow, a Navion is just what you need. Ryan representatives in your flight district can show you, or illustrate booklet what a Navion

"Tribian" Amphib Attracts Wide Interest

Prototype of new British design will accommodate 3 to 4 passengers. Feeder, military versions planned.

(McGraw-Hill World News)

Landed—An encouraging number of inquiries from many countries have followed the initial announcement of the "Tribian," a new all-weather amphibious personal plane being developed by Spence Developments Ltd., of England. The company hopes to have a prototype in the air early in 1949.

The Tribian, even in model form, was not on display at the recent Show of British Aircraft Construction, exhibited at Farnborough, since the firm is not a member. It was exhibited to be shown, however, at the aircraft display in Oslo when it was to be the only British aircraft on exhibit.

Initial Model—Tentative arrangements have already been worked out to license a Norwegian builder for the Scandinavian countries. Qualified production in Britain will eventually be restricted to a large venture aircraft builder. The company not now building aircraft, is understood to be willing to assist in the project.

Initial version of the Tribian will be a two-seater 3 to 4-passenger plane. Construction of the nacelle of the Tribian is now complete at the Bath, Somerset works of Tribian Langley Laboratories Ltd. (Magna Langley), manufacturing director is the key figure in the design work on the Tribian as

used by Spence Developments' own staff.

Airline Interest—Many interested parties have asked for a plane with greater seating capacity, hence the company also expects to proceed immediately with a 3 to 6-passenger version aimed at the feeder-line transport market.

British South American Airways, which has just placed an order for three Short Sealand 5s to 6-passenger airships, is known to be interested in the Tribian project. A small feeder transport amphibious five type would have great potential usefulness in carrying BSA's West Indian inter-island service.

British European Airways, also, is likely to consider the Tribian for possible expansion of BFA's internal services within the British Isles. An amphibious version in this model has advantage of the many island harbors, lakes and waterways in the main islands as well as in the numerous outlying islands too small for a land-based operation. Success to inspire much also should be feasible and potentially profitable. In addition to the two British airlines and the Scandinavian market, Spence Developments hopes to cash in on the interest already shown in their project by operators in the Far East. New Zealand, China, the East

Indies and India. In all these places the plane could be operated, either in its main island version, or in a smaller, from many beach landing strips, to the five major airports.

Other Types—A military version of the 3 to 4-seater is also contemplated, and for the future, a four-seater, 12 to 20 passenger transport to meet what the company calls "special requirements." Two separate main competitors for the "Tribian" are the G. H. Hudson "Dove."

As pointed out by the plane's designer, one of Spence's great needs would be met by the Tribian. It provides greater stability than the wing by British being airship-shaped they give no different lift and thus reduce maximum wing area. Loss of air under the wing helps break any loss the water on takeoff and landing, at the expense of a stiffer support for the undercarriage than does a wing.

Design Details

Intended to fulfill all the duties of a small Civil Aviation Organization or government, including landing at altitudes up to 5000 ft above sea level, the Tribian will be a twin-engine amphibious plane. Main landing gear wheels retract into the wingtip, sparsen, which turn into the hull, thus providing a stable wheel-track and extra room in the passenger compartment.

The wonderful Spence Developments own design although some

5 of the Best Friends a Pilot Ever Had!

All over the world—wherever man flies—Eclipse-Pioneer Flight Instruments are famous for accuracy and dependability. These inherent characteristics of quality and precision stem from long experience and the fact that Eclipse-Pioneer has built more five o'clock instruments and accessories than any other manufacturer. When you install these Eclipse-Pioneer Flight Instruments, men throughout the aviation industry will agree that you have placed your reliance in five of the best friends any pilot ever had.

Triumph—Specification Data

Wing		
Span	44 ft 6 in	
Root chord	6 ft	
Tip chord	4 ft 6.54 in	
Gross wing area	203 sq ft	
Alfons area	25 sq ft	
Flyer area	32 sq ft	
Tail		
Telephone area	29.4 sq ft	
Elevator area	22 sq ft	
Fin area	127 sq ft	
Rudder area	9 sq ft	
Fuselage		
Length	34 ft	
Height to top	13 ft 2 in	
Maximum height	12 ft 4 in	
Weights		
Empty weight	2085 lb	
Deposited load	1325 lb	
Maximum gross weight	4214 lb	
Wing loading	148 lb/sq ft	
Powerloading	11.6 hp/sq ft	
Proposed performance with two Grey Magne engines (145 hp)		
Maximum speed (sea level)	145 mph	
Cruising speed (sea level)	140 mph	
Cruising speed (10,000 ft)	135 mph	
Stalling speed (flaps down, engine off)	35 mph	
Initial rate of climb	900 ft/min	
Absolute ceiling	30,400 ft	
Service ceiling	30,100 ft	
Takoff distance (ft)	150 ft	
Takoff distance (mi)	308 ft	
Takoff time	25 sec	
Range, full load (with 60 gal of fuel)	190 mi	
Range, two passengers	580 mi	

► **Engine, Pratt & Whitney**—The company has decided to incorporate the Pratt & Whitney engines as standard equipment in all versions of the Triumph 40 engine on the company's world-wide network of servicing facilities and stocks of spares.

► **Variable-pitch constant speed props** are to be included. At the moment, both the fixed-pitch and constant types are contemplated, the latter having the weight factor as its favor.

► **Standard equipment** includes full instrumentation (Sensib) and a capital-controlled twin-channel VHF transceiver.

► **Performance**—The Triumph has a range of 510 mi with a full disposable load of 1,315 lb, short on pilot, 1 passenger, 114 lb of baggage, and 40 gal of fuel.

Alternately, with pilot and 2 passengers, 440 lb of baggage or freight and 40 gal of fuel can be carried the same distance.

Range and payload restrictions reduce rate that it can carry 1000 lb of useful load over 250 mi, 600 lb over 700 mi. With a 200 lb load, at when ferrying, it has a range of 1100 mi.

► **Testative selling price** for the 1 to 4-passenger Mark I Triumph is equivalent to \$14,000 including radio.

As this figure the company estimates they will break even on a production of 12 planes.

The price of the 5 to 6-seater model, they estimate, run to about \$40,000.

New Computer Solves Complex Problems

As electronic "slide rules" have been developed that solve problems of constant as fast as it takes for the motor to happen, and gives answers in a steady stream on a special tape.

The device is the Goodrich Aircraft Corp., Akron, Ohio, under special contract with the Air Force, this machine operates on power supplied from any cell source. It is 2 ft square, 4 ft high.

A panel, similar to a telephone switchboard, with a number of plug sockets is used to translate different equations by a variety of circuit combinations. Known constants in the equation are set into the machine by turning the value of the electronic constants connected to the binary simplifying units. Answers are obtained by translating the electronic outputs into the number of a recording pen.

A single computer is designed to perform twenty separate mathematical operations. Two or more units may be wired together for more complicated problems, and it's claimed that this book will solve approximately 95 percent of all computations that face the aircraft research engineer.

what assembling (that used in the Green and Midland) folds straight back during reaction, and is completely locked in, the fully closing half-door. All work-in-progress mechanisms are hydro-mechanically operated.

► **Wing Details**—Construction of the wing is conventional. It embeds two-point box frame design with fabric-covered skins and split trailing-edge flaps.

The two spars are pulled up by the two main landing-bar frames of the fuselage, as are the two spars at the wingtips.

► **Flexible, hinge-type fuel tanks** are located in the wing roots.

Wing tips and tail plane tips are detachably mated flaps made from "D-tube," a new laminated paper-based structural material, which should facilitate replacement in case of damage.

► **Backup systems** in addition to housing the main gear, are added, metal-link, float type, and buoyancy chambers at the roots.

► **Thrust**—That structure is an improvement on the fixed-wing design. It incorporates a four-point tail nacelle made up of two sections, fixed in position, and speed 12 is apart, moving

the full length of the tail to the rear edge of the step. This construction provides a strong link, permits the nose-wheel to be retracted between the two locations, and permits a dropped wheel, way in the passenger compartment to allow 6 in. more headroom.

A generic luggage compartment is provided behind the main seat. To carry larger amounts of baggage, the hull can be modified to provide a very large loading door. The whole panel between two fuselage and extending from the dorsal capsule to below the window line could thus be dropped down for loading purposes.

Two watertight mailboxes, free and tilt of the cabin-and-luggage compartment, give the watertight cabin floor, make for maximum safety on the water landing purpose.

A molded rubber nose sheathing is incorporated.

► **Landing Gear**—Goodrich constant wheel, as used for the landing gear. The Goodrich landing gear is operative even submerged and can be used in shallow water landing.

For operation on ice, the water landing gear and spacers are detachable to allow a gear of 30 ft disposable, and 10 ft. Six skis would attach to the spacers.

New Knock Rating Near for Aviation Fuel

Procedure is being devised to cope with perplexing problem posed by powerful fuels for piston engines.

By Robert McLane

A new method of rating the knock, or characteristics of aviation fuels, may solve the acute problem existing in this field. The procedure has been developed by the Coordinating Fuel and Transport Research Committee of the Coordinating Research Council, Inc., the official fuel rating body in the United States.

The new approach has been devised to keep pace with the phenomenal increase in aviation fuel knock ratings, which have already outstripped all of the present scales and test methods used.

▶ **Older Knock-Rating** In fact, tests have been 10 years ago when Dr. Edward Edgar, discredited knock test (2,4-dinitrotoluene) and observed that it knocked less than any gasoline then available.

At about the same time he proposed a new test and observed that it knocked more than any gasoline. By then, however, the engine rating of motor fuels, Dr. Edgar found the possibility of establishing ratings of knocking characteristics for comparing all available gas fuels.

The original proposal was that U. S. motor gasoline specification be revised to require that the knocking tendency of a given fuel be equal to that of a standard gasoline not less than 45 percent octane in a heptane, at a 45 octane fuel.

▶ **Method Adopted**—After considerable research, problems of standardization of a test engine and consistent changes in the original proposal, the Cooperative

Fuel Research Committee adopted the procedure now in use in 1933.

The octane in a given a rating of 100 and a heptane a rating of 0. A standard CFR (Cooperative Fuel Research) single cylinder test engine is used and the knock rating of a new fuel is determined. A blend of octane and heptane is then used in the test engine until identical knock characteristics are obtained. The percent octane is then the "octane rating of the fuel."

▶ **100 Plus Problem**—Obviously, this octane rating system is applicable only to fuels having knock ratings equal to or below that of octane.

It was not long before aviation fuels were available with 100 octane ratings and the system had reached the limit of its usefulness. It was decided that given amounts of tetraethyl lead would be added to the octane, which carried its knock rating beyond the 100 mark.

This system followed the same procedure as the original octane-rating method and new fuels were tested in a standard engine under standard conditions and the knock performance determined. A blend of octane and tetraethyl lead was then derived with the same knock rating.

▶ **Shortcomings**—Nevertheless, as use of the CFR method spread and experience was gained in accuracy, several basic shortcomings of the system were revealed. For example, it was found that the use of lead additives did not vary the scale linearly, more anti-knock agents such as tetraethyl lead, benzene, alcohol, toluene, etc. being required proportionally as the scale increased.

Examination of this effect revealed that the original octane scale ceases to be linear at about 128, that is, regardless of the amount of additive present, the knock rating of a fuel could not have a value in excess of 120.

▶ **Present Newer-Airframe** drawback, to the system is that the octane rating of a fuel varies from engine to engine, leading to inconsistencies in results when a specified test fuel is used at the same test aircraft design performance.

To solve this problem, the Army and Navy created the "performance number" system—a series of numbers extending from 10 to 160 but designed primarily to apply to fuels with a rating of 100 or over.

In this system, a fuel is tested in a variety of engine ratings from a single cylinder test and in a double-row, air-cooled, piston and the average knock rating of the test gives a performance number.

The method is the same in the engine but the manner of operating varies is different. For example, if a new fuel has a knock rating the same as octane plus 20 milliliters of tetraethyl lead, its rating is reported as 116 performance number, according to a chart (Fig. 1).

▶ **Motor Problem**—Still another case back to the original system was the variation of knock rating with machine noise.

Early in World War II the services required some means of evaluating the rich mixture performance of fuels and the CFR method used and experience was gained in accuracy, several basic shortcomings of the system were revealed. For example, it was found that the use of lead additives did not vary the scale linearly, more anti-knock agents such as tetraethyl lead, benzene, alcohol, toluene, etc. being required proportionally as the scale increased.

The F-4 method proved satisfactory for rich mixture studies but it was not possible to obtain the same accuracy and ease of operation under less machine

Fig. 1 (left): Forced reliability of the octane scale, against knock and octane scale is shown here. Fig. 4 (right): Type of data obtained from motor tests conducted with the new F-21 method.

shows wider coverage of tests over previous methods, accompanied by freedom of conditions tested. All of the data are measured only in the test engine.

conditions. The F-3 method was then developed to allow the octane rating of fuels under less machine conditions. With both methods, a complete range of octane ratings was determined for any given fuel and the results given in the form of a combustion rating, such as 115/145, indicating a fuel with a lean mixture rating of 115 octane and a rich mixture rating of 145.

This fuel, specification AN-F-35, was used in the latter part of the war, but emergency power not being required in postwar flight operations it use has been confined to special flights only and the 100/130 grade, specification AN-F-28, a new standard in both services.

▶ **New Method**—After V. J. Davis, however, the services needed their demand for even higher knock ratings. Under several previous high-power aircraft engines depend for maximum performance on extremely high knock-rated fuels.

Service has had determined that the F-3 method was not wholly satisfactory for less machine ratings above about 140 performance number and because less than 155 performance number. Also, combined use of the F-3 and F-4 methods required dual equipment and tests, and when exposed increasing interest in a single method that would determine fuel characteristics.

▶ **Tufts Selects**—The problem of producing a single reference fuel for all is a difficult one. The scale must be continuous; it should involve a mass with number of reference fuels and it should cover the complete range of knock-rated performance levels to be encountered.

At last, in 1946 the Aviation Fuel Division of CFR began an extensive study of the problem of creating a new scale and a new reference fuel for use in a new test engine.

It was obvious from the start that the type of reference fuel used would influence largely the scale finally derived and this was the first problem attacked.

After examining a number of fuels and the possibility of adequate supply of superfuels, the committee selected toluene (2,3,4-trimethylbenzene) as the best available. The resulting reference fuel was a leaded blend of toluene and normal heptane designated L-741.

▶ **New Scale**—The past four years have been devoted to an examination of all available and proposed scales to determine which one most closely satisfies the requirements for a new scale outboard scale.

During the course of these investigations it was observed that plots of scales based on octane became discontinuous at also passing 100 (Fig. 2). It was

also observed that plots of the reciprocal of the knock-induced octane scale effective pressure against the percentage L-741 produced a straight line (Fig. 3). To avoid excessive decimal points, the stepdown was multiplied by 1000 to produce an octane of 1000 units.

Extensive tests are indicating that this leaded toluene heptane possesses all the requirements for a new scale.

▶ **New Engine**—To provide the data required for this new scale, the F-21 method has been developed a high compression, with a single engine and test gas, under both the F-3 and F-4 methods formerly used. It enables the fuel to be tested over both lean and rich mixture conditions and range of 150 to 190°F.

The new engine, manufactured by Westlake Motor Co., is equipped with two fuel pumps, one for each of the fuels, permitting rapid change between the test fuel and the reference fuel before the engine temperature has a chance to change.

▶ **Data Required**—The engine is set in operation and its crank, one of brake mean effective pressure and friction mean effective pressure, fuel-air ratio, coolant inlet and outlet temperatures, and manifold inlet air and fuel pressures are recorded.

Fuel supply is then switched and the readings repeated. The mixture is then changed over a fairly wide range and the tests repeated at each ratio.

Results are then plotted in jump against fuel-air ratio (Fig. 4). When the test and reference fuels follow each other very closely at two or three different intake air temperatures, then the test fuel has the same rating as the reference fuel.

The reference fuel is then looked up on the dimension scales (Fig. 5) and the test fuel is then rated according to this order.

Fig. 3 (left): Army-Navy performance number scale developed from use to motor fuels with knock ratings below that 100. Fuel were tested against tetraethyl lead in its own series, and rated according to this scale. Fig. 2 (right): Discontinuity of octane scale.

OBSOLETE!

The recurrent word in aeronautics . . . and life challenge that guards it on. The aviation industry knows that its best will only be good enough if it continues to be the best. That's why every factor contributing to this end should be of keen interest.

Wolf's Head has always made it a point to keep abreast of aircraft development. That's why Wolf's Head Oil . . . 100% pure Pennsylvania, premium grade . . . is known today as the "finest of the fine" aviation oil. It's the reason so many experts depend on Wolf's Head . . . a superior refinement of only the finest Pennsylvania crude . . . to meet the demands of today's powerful aircraft engines. Wolf's Head Oil Refining Co., Inc., Oil City, Pa., New York 16, N. Y.

Oil reclamation program is aided by maintenance tag which has tabs of accumulated used fuel to facilitate drainage from each on the line. Tanks were R-37 units.

Oil Re-use Offers Big Cost Saving

Re-refining procedures of the Air Force and airlines could also be economy measure for manufacturers.

Faced with dwindling supplies of aircraft engine oil and the further problem of how to buy 75 cent-a-gal. fuel on a 63 cent-a-gal. budget, the United States Air Force has put the collection of grade 1120 oil drawings on a nationwide basis—Air National Guard and Air Reserve included.

During World War II, reclaimed oil saved the Air Force over \$6,000,000 a month.

Re-refining returned 1,000,000 gal. of crankcase drawings a month to top-grade aircraft engine oil specifications.

"After the war, when the critical need to conserve oil disappeared, USAF's re-refining program dropped off."

► **Reclamation Statistics**—Now, with the new nationwide program only a few months old, 35 cent-a-gal. re-refined oil amounts to 25 percent of the total now used by USAF.

Last year fiscal 1947-48, of a total of 5,877,000 gal. used, nearly 1,600,000 gal. were reclaimed for regular use this year.

Goal is to raise the rest of the country to the all-out record of the Oklahoma City Air Materiel Area, where 40 percent of all losses were reclaimed.

This Area, because of its outstanding record, was selected to be the host for USAF's Oil Reclamation Conference held on Nov. 1-2.

USAF plans to apply its refining to marine vehicle crankcase drawings, as well. Lubri, it aims to include most of its aviation services in the program. Alaska is first on the overseas list.

► **Airbus Participation**—Re-refining is not new, either to USAF or to the rest

of the country. U. S. Army Air Forces tried it successfully in the first world war. With first operation of tanks, cars, and anti-aircraft equipment as main customers, it has been a growing U. S. industry since the early 1910's.

U. S. re-refining capacity has increased 400 percent since 1919, with present annual production at over 45,000,000 gal.

American Airlines has been testing re-refining methods since well before the war.

Today both American and Pan American airlines sort oil from crankcase drawings from periodic oil changes and engine overhauls.

American now re-refines 1,800 gal. monthly at its Columbia Field, Wash. (near Tulsa plant) gets into operation, the figure is expected to run close to 3,000 per month.

Both airlines operate their own equipment using "used" (scrubbed) stills run by Refining Vels. Corp., Kansas City, Mo. However, this procedure isn't compulsory, since commercial refineries are able to restore oil in any required specifications.

USAF has all its work done by commercial processors to bring used oil back up to new lubrication standards.

► **Cost Data**—Cost of re-refining runs on from \$7.50 to a 70¢ gal-per-half-hour portable still owned by Precision Processors, Kansas City, up into the hundreds of thousands of dollars for full scale refineries, complete with free-hauling towers capable of handling thousands of gallons a day.

deposition, moisture, labor, power, etc.) ranges from 1 to 20 cents a gal. If special chemicals are added to make an additive of the sort goes up, but never enough over a quarter the cost of new oil of the same quality.

Cheaper processing comes with portable units which, generally, don't generate as thoroughly as larger units.

Installations with a capacity of around 5,000 gal. a month and capable of meeting 1125 requirements run about \$10,000 apiece.

► **Considerations for Operators**—Airline cost figures show the advantage of recovering amount of damage at any one central point is the main factor. The largest total oil requirements will show that properties could be saved. Usually from 75 to 90 percent of the damage is to be processed are finally captured as good oil.

Airline petroleum engineers point out that recycling would be a greater advantage to aircraft and engine manufacturers than to airlines. Reason is that because of frequent damage (after tests, etc.) they discard more than they burn.

Some airlines get manufacturers' savings at 60-70 percent of total oil requirements, against less than 30 percent for the airlines.

► **Process Details**—Re-refining is actually

a second refining, with certain necessary steps omitted. These include re-refining and de-waxing, which, having been done originally are not necessary during re-refining, since wastes were removed don't occur.

Main object of re-refining is to remove acids, aldehydes and other oxidation products, water, light ends such as gasoline and kerosene, dyes, sludge, sludge, and compounds, metallic dirt and other impurities which were not in the oil at the time of its original processing, at its possible, to return it to new oil quality.

Practically all re-refining follows the pattern of one of the other of two main processes used by the petroleum industry. There are the same present still process and the newer, lower temperature, vacuum distillation. The two processes are similar, except that in one, distillation and fractionation occur at about atmospheric pressure and in the other, under a vacuum.

Steps in re-refining basically break down as follows:

1. Removal of solid particles by settling, centrifuging, or filtering at all three.
2. Sulfuric acid treatment to get metallic gases, gases and other matter.
3. Alkaline treatment to neutralize acid compounds.

► **Water**—used to remove water formed in neutralization.

► **5. Mixing** with special oils, such as 1-ether, to bleach oil and absorb certain impurities. In some cases filtering is immediate.

► **6. Distillation**—heat and steam processing either in the filtered oil at the aldehyde reactor, sulfur under pressure or in a vacuum to drive off moisture, light ends and other volatiles.

► **7. High pressure filtering** to remove clay and other solids. (Step 1 is sometimes combined with this procedure. With respect to step 5, favorable procedure is to leave clay in residue until this step—7.)

Sulfur and treatment (step 2) is one which should only be used where "fine grid" matters are to be processed, such as those picked up from miscellaneous stations.

Heavy grades and other probably impurities in these damage areas usually approach crude oil and most closely to sulfuric acid. However, carefully oil-based wastes of the same grade oil which may contain organic contaminants are likely to become over-refined and lose some of their original lubricant qualities.

► **Additives**—Also used in re-refining are chemical additives which may have been put in the oil by the original

manufacturer to slow sludge and acid formation. These can, however, be added again after re-refining.

Re-refiners who wish to make an oil drive oil don't need a special laboratory to do it. Petroleum companies and major chemical firms will run tests on the base oil sample and tell the re-refiner what he should add. The service is free of charge—only requirement is that the re-refiner buy his chemicals from a testing firm.

Most re-refiners, while not having re-refining laboratory facilities for all drive tests, are able to check on basis of characteristics, such as flash and loss point, viscosity index, carbon content, etc.

► **Vacuum vs. Pressure**—Of the two processes, vacuum and pressure, the former method seems to be more satisfactory.

Newest commercial re-refining plant, Worthington Refining Inc., Reddy, Va., now being rebuilt, after a fire, is a \$2,500,000 vacuum process plant, it is capable of handling 9,000 gal. daily—hope to get some useful business from Washington National Airport.

Main advantage of the vacuum seems to be that it yields a quality of oil less dense, at low expense, and with a smaller installation. Base oil specifications are not a really cost

factor of re-refining seems common. Any re-refining to test waste collection and re-refining even as other way out.

It points out that the collection problem for the Air Force is relatively simple, because of its few bases, whereas this problem is of a much more complex nature.

If it is purely economical, Army plans to extend the program throughout the country.

Meanwhile, re-refiners are looking for one or two new customers—a few are even checking the export market. Other eye is on the 11,300,000 barrels of steel oil which annually go down the drain.

Aluminum Foil Used In Fire-Fighting Suit

A new fire fighting garment composed of laminated aluminum foil and cotton cloth, capable of withstanding the 1500 1500 deg. F. heat of oil and gas fires, has been developed by Clothing Branch, Army Medical Laboratory, Fort Monmouth, N.J.

The new suit approaches 100 percent in its ability to reflect the infra red rays of radiated heat.

It weighs only 5.52 lb. compared to the 22-25 lb. and 45-54 lb. for suits now in service, permits greater ease of movement, and requires a shorter period of time to put on.

The garment's main plate is a high vacuum deposit of gold on glass which serves as an excellent reflector of heat, although possessing ability to pass visible light.

However, for widespread use, a less expensive method is being sought, one possibly being a plate that absorbs a few thin reflective heat rays, since heat absorbing glass is available to withstand the heat so which the suit would be subjected.

Although the suit reflects rays of radiated heat substantially, further development is required to produce an aluminum foil suit that does not tear, swell or peel when the wearer moves in contact with surrounding objects.

One approach to this problem is an investigation of methods of impregnating or processing other materials to render them heat absorbing.

Another development with the new type of garment is an aluminum foil cloth which retains heat rather than keeping it out, for use as an arctic suit. In using an aluminum foil inner layer, the Clothing Branch believes body heat may be maintained as warmth.

"Give us the tools . . ."

For High Wages, Full Employment . . . Business Must Have Better Tools and More Money to Pay for Them

So far we have escaped the post-war depression predicted by leading government economists. How can we continue to frustrate gloomy prophets who see only depression ahead?

At the end of World War II the federal Director of Reconstruction saw depression immediately ahead. He said we would have 6,000,000 unemployed four months after VJ-Day and 8,000,000 a few months later.

But we did not have depression. We did not because:

First, the American business man, among the obligations of a vastly more important post-war America, went ahead to build his plant and equipment to meet expanding domestic and world markets—markets bigger actually and potentially, in terms of world-wide trade and profits than any previously envisaged.

Second, the American businessman was able to get the money to go ahead. Since 1945 he has spent \$50 billion building new plants and buying new equipment.

There may be other reasons why we missed a depression in 1945. But—make no mistake about it—what has powered our present prosperity is the \$50 billion spent by businessmen since VJ-Day to improve their plants.

It provided jobs directly for 5 million people. It paid for more than half of our record-breaking steel output. It put in place the foundations of great new industries such as television. It

strengthened the foundations of the chemical, machinery, plastics, steel and oil industries. It has expanded and improved our power systems throughout the country.

This spending has made the difference between prosperity and slump, between industrial strength and serious deterioration.

In fact, we know now that what business needs for new plants and new tools always makes the difference between prosperity and slump, the difference between national strength and weakness.

The accompanying chart tells the story. When we have spent heavily for new plants and equipment, we have had prosperity and strength. When we have not, we have been in trouble.

We would have been in trouble since VJ-Day except that business used its own reserves, plus two-thirds of its profits, plus borrowed money to improve and expand its facilities. This year industry is spending \$19 billion this way.

His this great post-war expansion actually made our economy a "mature economy." Have we come now to the saturation point the New Dealers mistakenly said we had reached in the '30's?

The answer is not.

Proof of that answer is being developed through a McGraw-Hill national survey of "Business Needs for New Plants and Equip-

ment" details of which will be given in this editorial series in coming months.

We have a bigger nation, more people, to serve right here at home. Further we must meet human needs which the war created around the world. Also, we must sustain a world position such as this country never assumed before.

Here are immediate things crying to be done.

1. *Business still needs billions to expand production* because our country and our needs are growing rapidly. Example: To meet the demand for power, electric utility companies must nearly double their present generating capacity in 10 years. That will cost more than \$7.5 billion. To fill increasing needs for oil and gasoline, oil companies must spend at least as much.

2. *Business still needs billions to get its plants up to date and overcome wear and tear.* Example: Over half a million of our freight cars, a third of the total, are more than a quarter of a century old. About two-thirds of the looms in the textile industry are more than 20 years old. Half of our coke ovens, basic equipment for iron and steel production, are more than 20 years old, and only half as efficient as modern ovens.

3. *Business still needs many billions to do new things in dramatic new ways.* Example: Machinery that will cut out 80% of the dirty,

dangerous work of mining soft coal has been perfected. A new automobile engine plant will reduce the work that goes into engine-building by three-quarters.

Hundreds of similar things that our scientists and engineers have developed could be cited. They can be found in every industry. They hold immeasurable promise of adding to the abundance of American living. In fact, there is hardly a step along the whole route of industry—from roughing out raw materials to delivering finished goods—where there are not new and better ways of doing things standing ready for general use.

But the crucial question now is: Where is the money coming from to put to work these new and better ways of doing things?

Business has used its own resources so far—profits and reserves. The stock market, where industry traditionally has raised money from people willing to risk their savings, has been limping along, giving business no chance to get enough money on satisfactory terms. *Business now must look primarily to its own earnings for the money to carry out the improvements which are necessary if America is to keep itself strong and efficient.* The next editorial in this series will deal with this new and crucially-important role of profits.

But business can not count on profits alone to do the job. Profits are too uncertain.

From now on finding the money . . . to get new ideas and new equipment to work . . . to go ahead with the expansion and improvement that will thrust depression and build industrial strength . . . falls for the support of all Americans everywhere.

There comes right down to you . . . for at stake is your chance for steady work, for better pay, for new things like television, and for more of the everyday things, like coal and clothing, of better quality and at less cost.

By helping business get new and better tools, you will help yourself—and you will help build a more sound, more prosperous, better America.

James H. McGraw, Jr.

President McGraw-Hill Publishing Company, Inc.

NEW AVIATION PRODUCTS

Fuel Shut-off Valve

High capacity and controlled actuation are highlights of new "Shut-Off" electro-operated, fuel shut-off valve made by Sural, Inc., 1935 East 51st St., Los Angeles 11, Calif. Designed specially for rapid actuation in flight, device is also electrically suitable for single-point fueling operation. Unit distributed, No. 5568, is for 74-in. tube size. Working pressure is 60 psi., weight is 5 lb. 3 oz. Stainless steel internal parts are housed in cast aluminum body. Valve has straight-through line passage with no diaphragms to cause turbulence. Actuator is 22.25 in. d.c. Rated load current is 1.5 amp. at 24v. Warning permits use of indicator lights and AN approved switch is used for latching. Switch wiper arm is for 1/8, 3/8, 1/2 and 3/4-in. tube sizes. Valves are adaptable for hydraulic, water, oil and hot air as well as automatic fuel.

UHF Noise Diode

New ultra high frequency diode tube, 11 J, used for maximum sensitivity in radar receiver and detector circuit which it can be used satisfactorily, is offered by Eclipse Pioneer Div., Radio Aviation Corp., Luzerne, Pa. 15486. Developed by Radio City of America, tube is 5 in. long, 2 in. in diameter. It supplies electron pulse for determining receiver sensitivity, is reported smaller than equal generation now in general use, and radiates maximum signal necessary for reception over outside air traffic routes.

Rotating Shaft Seal

Marked by Gals Brothers Mfg. Co. 1546 Kellum Ave., Chicago, 25, Ill., rotating seal is claimed suitable for water oil, and fuel pumps, speed reducers, etc. so prevent leakage of liquids or gases along rotating shaft where no other pieces in contact. Rotating seal has a integral unit held by compression spring against fixed sealant. Operating conditions determine amount of spring pressure, necessary to make sealing possible, and diaphragm material used for lapped wearing surfaces and other con-

ditions. Double seals are also available, designed for installations where liquid being sealed cannot act as a lubricant or coolant, and a separate liquid supply is admitted into seal chamber.

Light-Aluminum Oil Filter

New FB5 oil filter made by Fasco Corp., Providence 16, R. I., is for use on light aircraft engines and mounting 135 cu. in. displacement. Distributed by Air Associates Inc., Teterboro, N. J., device is claimed to shorten engine cleaning time by 5 to 6 hr. at major overhaul. Weight (oil filled to capacity) is 2 lb. 10 oz. Two oil outlets are provided, either being available to link tube radiators and obtain shortest external inlet and return lines. Series of dumping depending CMA approved installation is available.

Electrical Harness Clamp

To avoid short-circuiting of wires from abrasion, Model TS470 light-weight clamp of 032 is .245T is announced by Therman Associates, 46-7 44th St., Long Beach 20, Calif. Fast, easy feature is V wedge of rubber web covered to 942 in. rubber neoprene, and as clamp is closed, wedge pressure locks to complete rubber grommet. Units are available in 4 sizes from 1 to 4 in. increments of .4 in.

No Sea Moss on the Albatross!

THE ALBATROSS, made for Division Aircraft, top meeting. One Albatross amphibious aircraft, is a new amphibious aircraft for amphibious operations. Designed for amphibious operations, it can be used for amphibious operations. It is a new amphibious aircraft for amphibious operations.

An important factor in making planes of all types lighter and stronger is correct Aircraft Tubing. inherent strength without weight advantages make correct Aircraft Tubing ideal for engine mounts, strut assemblies, radiator controls, fuselage frames, hydraulic systems, and other applications. And these are added benefits from specialized forming and machining qualities, plus the knowledge that all correct Aircraft Tubing is produced to Army, Navy and AMS specifications.

correct is the precise and widely recognized leader in aircraft tubing—known for precision craftsmanship and low percentage of rejects. Our stock is complete in a wide range of sizes, and we can assure you immediate deliveries. So contact your nearest correct Sales Office and arrange a meeting with an correct Aircraft Tubing Specialist. He'll gladly sit in on your product planning and discuss ways in which correct can further your progress. No obligation, of course.

SALES & SERVICE

Plan Studied to Cut Training Costs

Four-place planes would be used to conduct group instruction offering many benefits over normal method.

By Alexander McHenry

Proposal to cut costs of learning to fly and add more interest to cross-country four-place plane flying by a new experimental curriculum for the private pilot is being evolved by the Ohio aeronautics department.

Main novelty of the new course is its use of the classroom teaching technique, combining three students with one instructor in a four-place personal or business-type plane, and giving the students extensive cross-country experience.

C. E. Basso, Ohio aeronautics director, and one of the organizers of the progressive cross-country curriculum which is gaining wide recognition, is co-chairing a minority of the proposed course for aviation group members. If the response is greatly favorable, there is a good prospect that a final course will be conducted.

Course outline includes:

- Stage 1—15 hr. for three students and one instructor in four-place plane, during which each student receives 5 hr.

COMMANDO CLASSROOM

Fifth grade students at Sunset Elementary School, West Potosi, Mo., are eager to take aviation studies as an elective course. Below the driver in flight, George Vain, traffic control, etc., are taught in this

instruction at controls while the other two students observe from the back seat. Students will be rotated at not more than half-hour intervals, and will make three cross-country trips to strange fields and study landmarks of take-off, landing, taxi, rectangular courses, glide control and stall recognition.

- Stage 2—6 hr. for each student in a two-place plane during which he reviews fundamental position, spin, spinners, wheel landings, stall recognition, and so on.

- Stage 3—15 hr. in four-place plane after same arrangement as in Stage 1 with emphasis on cross-country, no spin, strange airports, etc.

- Stage 4—9 hr. in two-place aircraft for each student preparation for private license including spin recovery (if still required), stall recognition, approaches and full stall landings, rectangular courses, solo cross-country, and private pilot examination.

The proposed course includes 45 hr. total flight experience including 18 hr. in a four-place plane, compared to the

usual 35 hr., all in a two-place plane. However, it is estimated that on a basis of existing aircraft rates the training per student adds up to 15 hr. of two-place training at \$10 an hr. and 30 hr. of four-place training at \$15 an hr.—for a total of \$105 for the 45 hr. compared to \$150 for 35 hr. of two-place plane flight experience.

• **Fixed and Proven.**—Brown recalls that in the early days of the government-sponsored Civilian Pilot Training Program, CAA, introduced in a cross-country course between secondary and commercial courses which trained students three at a time in a four-place plane. Such flight training for advanced students is used by the airlines and the USAF and the Navy for group value instruction, and the method has been found successful. The new curriculum would extend the group training method for the first time, it is believed to the earliest stage of flight experience.

Besides the obvious advantage of cutting the total cost of a private course, thereby reaching a larger market of aspiring students, the proponents of the new course point out other expected benefits.

- Under the conventional course the student spends much more time as a listener and observer, while the instructor flies the plane, explains maneuvers or demonstrates student errors. With group training and rotation of students at the controls, each has opportunity to learn observe and compare without distraction of hand-line controls at the same time. Meanwhile he is still expanding and becoming accustomed to the sensation of flying.

- Each student can compare his work with that of two other pupils of equal or better experience thereby removing dissatisfaction which often affects pupils in two-place plane flight training as they compare their own first efforts with effortless ease and precision of their flight instructor.

- Conversation between students often is stimulant to student interest.
- Group participation gives each student more confidence, and tends to overcome fear.

- Use of pushover type aircraft in trainer facilitates the student with the type of crash he probably will own later if he can afford it and the cross-country experiences show him the advantages of such ownership.

The Ohio aeronautics director expects that the course could be worthwhiled by flight operators on a basis of miles flown rather than on the hours flown.

A curriculum offering 500 miles of flight in 45 hr. at \$108 figures out at the modest rate of 6 cents a mile transportation—a cost comparable to highway travel. When it is added that \$600

When you're glad you have a Snap-on

Snap-on
Heavy Duty Ratchet
speeds landing gear service
... keeps 'em flying!

EXTRA powerful leverage . . . precision-built, reversible ratcheting mechanism . . . year-after-year dependability . . . these are the features you find in a Snap-on

Beechcraft Bonanza...

...has a
FEATHER-WEIGHT
in its
"Cool-Tank"

The Beechcraft Bonanza (Model 33) All-Altitude Four-Place Bonanza, a recent addition of Beech Aircraft Corporation, Wichita, Kansas, has a FEATHER-WEIGHT All-Altitude Oil Cooler built into the Beech-designed "Cool-Tank".

The Beechcraft Bonanza is another of the growing numbers of modern aircraft that are taking advantage of the unique construction and accurate testing of FEATHER-WEIGHT oil coolers.

Light, strong and compact because their thin, aluminum sections are based with aluminum alloy, FEATHER-WEIGHT oil coolers offer maximum resistance to extremes of temperature, pressure, vibration and shock.

Testing in the largest, most modern wind tunnel laboratory in the aeronautical heat exchanger industry accurately predicts FEATHER-WEIGHT performance under actual flying conditions. Inquiries concerning FEATHER-WEIGHT all-aluminum oil coolers are invited. CLIFFORD MANUFACTURING COMPANY, 561 Grove St., Waltham 54, Massachusetts Division of Standard-Thomson Corp., Offices in New York, Detroit, Chicago, Los Angeles.

CLIFFORD

ALL-ALUMINUM OIL COOLERS

HYDRAULICALLY-FORMED BELLOWS

order of 100 ft. in four-plus, positive landing type requires this should be added to the owner's schedule in persons who might not be interested in the on-boarding position of 55 ft. in a plane or economy in a single plane.

► **Passing-Go reactions:** That the owner does not meet present requirements for the private pilot certificate Brown repeats.

That is not a question that can be answered before the plane of the coming primary construction. It is rather a challenge to government and industry to prove that the principles outlined are wrong. If they cannot be proved wrong, regulations should be changed so that agencies and students who reap the rewards of modern educational methods.

It reports that some agencies have commented that the proposed course might meet requirements with a slight change in hours, and if CAA would give part credit for controlled observation hours.

And he suggests that while the aviation industry is waiting for the development of improved safe, new and other personal airplanes of the future, methods in new improved teaching techniques might well make it possible to get greater safety out of the NAAB or more personal planes now flying. Such research should include controlled observation experience, coordinate training measures and replace the present private pilot test with modern criteria that would really test the product of an effective private training course. Brown concludes.

SOVA DIRECTORY

Probably the most complete and useful airport directory yet prepared by any state organization in the area. The directory contains a complete list of airports, roads, and other facilities. It is a valuable reference for anyone traveling in the area. The directory is available in both printed and microfilm formats. The printed version is available for \$1.00 and the microfilm version for \$2.00. The directory is available from the National Aeronautics and Space Administration (NASA) or from the National Aeronautics and Space Administration (NASA).

BRIEFING FOR DEALERS & DISTRIBUTORS

SOUTH RYAN NAVION—Ryan Aeronautical Co. delivered its 500th Ryan Navion low-wing all-metal private plane last month with a year after taking out production of the airplane from North American. Added to previous North American Navion production this totals the 1013th Navion built.

Robert Hangerford, pilot for Gills Flying Service, Billings, Mont., received the plane from Earl F. Swisher, Billings, Mont., for a business delivery. Meanwhile Ryan also made delivery last month of its last L-17B Navion military utility and liaison plane to the Army Field Force, Capt. Charles G. George, in charge of the AFF on station, took the plane at San Diego to deliver it at Ft. Monmouth, N.J., for a special demonstration, after which it was to be taken to Air Materiel Command Headquarters, Wright Field, Dayton, for continued service testing.

Contract calls for delivery of one third of a total of 158 Navions and spare equal to 60 more planes to accompany bases abroad, one third to AF and one third to national guard units in this country. The San Diego manufacturing also reported a new high of 74 Navion deliveries in October.

PRIVATE PILOT PROFICIENCY—After completion of present flight tests on airline pilot proficiency, CAA researchers hope to conduct pilot proficiency tests on typical private pilots using generally similar techniques adopted to private flying. Ultimate objective is to revise private pilot standards and examinations toward a more realistic and scientific appraisal of pilot capability than the current "ride-of-the-horse" method.

AIRPORT REVENUE SOURCES—Real-estate profit in non-aeronautical concessions at airports to bring in additional revenue will depend largely on the ability of the airport management to furnish attractive surroundings, facilities in a modern terminal and the use and expansion of the field. Dr. Leslie A. Ryan, of the University of Illinois Institute of Aeronautics told the New York Airport Manager Conference at Syracuse. However, from 50 to 70 percent of all airport revenue should come from non-aeronautical sources, with special emphasis on restaurant revenues.

LIGHTPLANE DEVELOPMENTS—Cessna Aircraft Corp. is doing more work on quiet propulsion than anyone else among the personal plane makers. In addition to the four-blade wooden Semachute shown at a Cessna at the Flying Fairway meeting in Columbus, the company is experimenting with a push-bladed McCauley aluminum propeller which may soon set to be the standard engine for light aircraft. The use and simplicity of configuration which has been reported. — **Piper Aircraft Corp.** has a new management opening for the front seats of the four-seater Pacer. The new design allows the passenger but somewhat tricky folding of the right front seat, a factor which has bothered some users of the plane this year. The new arrangement is said to be the result of the use of a track. — **Textron Engineering & Manufacturing** is experimenting with a tandem tandem version of the all-metal low-wing Swift 115.

SELLING EXECUTIVE TRAVEL—A story which nearly every local business agent could sell to local newspapers is a publication in the form of a personal travel agent and local guide which would have definite promotional value for his agent operation. It is the story of executive travel as the leading executives of his community.

All he need do is to go down and figure out the number of local business men who are going to his airport, the amount of air travel they do, the places they go, and then call up the local newspapers for a consultation and request for some pictures and interviews with the individuals. One of the best examples of this type story which has come this way available is the full page picture and story feature in the Oct. 17 Reading (Pa.) Eagle, prepared by the company's aviation reporter, Nick Meyer. He would get executive travel activities and only by sending Massaguard photos to the local newspaper. The story is the Reading (Pa.) Reading Aviation Service Inc., Navion distributor, presumably had something to do with the feature since the distribution shows Navion and their own street exclusively.

—ALEXANDER MASURELY

Stock Analysts Report on Aviation

Two market letters examine earning potentials of both manufacturers and carriers in war and peace.

The aviation industry is showing increasing activities among investment funds. This is evident by the recent issue of separate reports of this group by two leading investment advisory services. The Value Line published by Accord Bookings & Co. of New York screens the charts of the aircraft and airline groups, while Moody's Stock Service continues its study to the airlines.

The Value Line, in a compact report, analyzes the status of the two aviation groups under wartime or peacetime conditions. This it made with the distinct conviction that war is contained in probable near years.

■ **Profits Soar**—In the event of war, Value Line expects the aircraft manufacturing industry will be operating at volume levels through profit restrictions, the aircraft builders are expected to develop substantial earning power. A not trailing element is expected to be the extent profits tax imposed on all corporations.

Based on precedents, aviation invested capital as percent earnings may be used as a base for determination of such as profit tax. In view of the historic background developed in this respect, most aircraft companies should have a far better basis with which to carry earnings than provided during World War II, according to Value Line.

Further, under international conditions, the aircraft industry would most likely secure big profits in obtaining all the necessary materials as well as being assured of adequate labor. Moreover, it is believed that the likelihood of labor strikes would be minimized.

■ **Better War-Time**—The Value Line survey concludes that the aircraft industry, probably will do much better in wartime net earnings if war is avoided. A high level of expenditures is currently needed for military preparations with not all of the extended profit restrictions imposed in time of national emergency.

The long-term outlook for next six to eight years is considered through 1945, whether 1945 is a wartime or a peacetime year. The full effect of the 1948 appropriations is expected to be felt next year. Earnings for 1948 are expected to show some improvement over 1947 mainly because development ex-

penses for new model aircraft were not as high last year, the manufacturers then having been able to take advantage of their old rate of development.

■ **Huge for Carriers**—An optimistic view of the airlines also is taken by Value Line. In the event of war, the pattern of operations for the airlines is expected to be the same as presented during the last war, but will be modified, the airlines concerned under private ownership and independent management but operations were coordinated with the requirements of the military.

Note is made of the fact that the airlines have recognized that the airlines are concerned in maintaining the lines of rapid transportation both from the standpoint of war operations and of assuring a steady production flow of vital materials.

Considerable benefits are expected to accrue to the airlines should war develop. In the first case, greater traffic flows will be generated, thus assuring capacity passenger, cargo and mail loads on most days. Modification and training programs also again be undertaken on a large scale. Moreover, considerable contract operations again may be secured to supplement military air transport activities, according to this investment service.

■ **Stable**—Value Line notes that the preparation program under conditions of peace is bound to be very constructive for the airlines. Considerable as desired activity is created, thus providing a greater stimulus for air travel. Past studies are reported to have demonstrated that emergency business conditions have provided a healthy base for the industry. It is the industry with a travel expense account who can be expected more readily to take the relatively higher cost airplane as preference to the train, particularly when time is at a premium.

The conclusion is advanced that most of the air transport companies are gradually getting out of the red. The year 1949 is expected to show an average improvement over the generally unprofitable 1948 results.

In addition to the general industry surveys, Value Line also presents detailed analyses with long term charts for 14 leading aircraft and airline companies.

■ **Some Answer**—Moody's Stock Service also is a valuable reference, especially in showing the airlines last years to be virtually the same conditions as the other analyses.

The opinion is expressed that there are individual companies possessing the finance and operating records to carry through the period of adjustment still ahead of the industry. Matching risks against financial resources, equipment needs, and other factors, transfer airlines appear to be favored by Moody's on this point. In this group, at least Eastern, Northwest 4-6 percent preferred, and American common. In addition, Aeronautics 14 percent preferred may also be selected, according to the same source. Moody's brief appraisal of the very rate air carriers are interesting and may be summarized as follows:

■ **American Airlines**—From a longer term point of view both the common and the preferred stocks have represented possibilities. Over the immediate future, continuation of dividend payments on the preferred appears reasonably safe.

■ **Transit Airway**—Good possibilities depend largely on the management's ability to expand foreign business, an expeditious field, in a highly competitive field. Stock is very speculative.

■ **Capital Airlines**—The present management has made some progress in bringing operations back on a profitable basis, but a 54 million bank loan, which is being extended only months at a time and a 50-55 million income debenture, so which sinking fund is in default place the common is a highly speculative investment.

■ **Eastern Air Lines**—The stock appears to be the standard equity in the air transport group and holds the least speculative risk.

■ **National Airlines**—The value of long term assets approximates current market price for the stock which is highly speculative.

■ **Northwest Airlines**—The common has the appeal. But, even if the preferred, through highly speculative should work out well over the longer term.

■ **TWA**—Under a new management, the stock has been made in increasing operating costs but debt is large and additional financing may be difficult except through the issuance of new stock.

■ **United Air Lines**—The lack of modern, fast two-engine equipment may prove a competitive disadvantage in the long run and result in relatively higher costs.

Ed. Note: The opinions reviewed here are those of one investment advisory service and not necessarily those of this writer. Neither the writer nor Aviation Week stands prepared to confirm the investment opinions indicated above.

—Sieg Altrich

AVOID THESE WINTER LOSSES!

WALTER SNOW FIGHTERS assure continuous winter operation

If your airport operates every time the snow delays it's time to equip with Walter Snow Fighters. Experience at America's leading commercial and military airports proves that no weatherman can get ahead of these fast, powerful, high-capacity snow removal units. Runways stay open for safe landings and takeoffs in severest snow storms.

As an example, two Walter Snow Fighters clear a 150-ft. width on a side of runway, in 30 minutes, at average snowfalls. Complete runway is cleared in one hour.

Only Walter Snow Fighters have the tremendous power and super traction to sustain plowing speeds of 20 to 30 mph on snow and slippery ice floors, without wheel spinning, skidding or stalling. At such high speeds, the specially de-

signed Walter plows and wings haul snow far to the side. A greater volume is removed on each run. Windrows are kept to safe levels. The runway surface is clean and safe.

No other snow removal equipment can match Walter Snow Fighters because no other truck has the 100% traction of Walter 4-Wheel Positive Drive. Have our representatives explain this great feature—or write for detailed literature.

Safety Glass BY "PITTSBURGH"

● In its effort to develop aircraft able to fly at supersonic speeds, at stratospheric heights, the aviation industry is facing new problems in airplane glass and glazing methods. Many of these problems are being solved successfully by the Pittsburgh Plate Glass Company.

By applying proven engineering principles and continuing an aggressive policy of product development, "Pittsburgh" is producing laminated transparent plastics, photographic glasses for aerial use, precision ground bullet-resistant glass for gun-sights, and a wide variety of glass and plastic combinations.

That "Pittsburgh" products are giving satisfactory service where exceptionally high pressures and temperatures prevail, is proved by the use of "Pittsburgh" Safety Glasses in most military and large commercial planes.

We invite you to bring your problems to "Pittsburgh," Pittsburgh Plate Glass Company, 2408-B Grant Building, Pittsburgh 23, Pennsylvania.

Mediation Ends National Strike

Former CAB Chairman Landis unifies secret three-week negotiations between company and pilots' union.

The longest and costliest strike in the history of American air transportation has been settled by National Airlines and the Air Line Pilots Association.

An agreement ending the 10-month-old walkout was reached on Nov. 24 after more than three weeks of secret negotiations between the company and the pilots' union in New York and Washington.

James M. Landis, former CAB chairman, now a Colonial Airlines director, acted as mediator and announced that the striking pilots will return to work as promptly as safety requirements permit.

● **Check-Outs Speeded**—Pilot lines established by ALPA at principal NAL stops since after the strike began last Feb. 1 have been dissolved. With check-outs being expedited by both company and union, ALPA crews probably will be returning to NAL planes within a month.

The dispute which caused the strike—discharge of ALPA pilot Martin G. O'Neil by National—was to be submitted to arbitration under supervision of the National Mediation Board. O'Neil was dismissed after a landing accident which occurred at Tampa, Fla., in September, 1945.

In general, the strike settlement provides for a return to working conditions which prevailed before the walkout began. National and ALPA expanded to feel that the agreement contained provisions for breaking future deadlocks in grievance cases, thus preventing strike action.

● **Suits Withdrawn**—Pending litigation between National and the pilots is to be

disputed, and all claims by both sides, including requests for wages during the strike, will be relinquished. During the first month of the walkout, NAL filed a \$5,000,000 damage suit against ALPA for libel and slander. Later, ALPA sued National for \$1,000,000 damages for financial losses suffered as a result of alleged nonemployment by the company with federal law.

About 125 nonunion pilots who flew National Airlines planes during the strike threatened employment as a result of the settlement. They have announced formation of a new union—National Pilots Association—and have invited all commercial pilots to join.

National Airlines President G. T. Bates reportedly assured pilots that during the strike they were "personally being compensated" by increasing the settlement, the carrier and provision for the benefit of its non-ALPA pilots will be made.

● **Security Facilities**—But since returning ALPA crewmen will be given their former security standings, the non-union pilots will for the most part be at the bottom of the employment ladder—ranking below ALPA members who were on furlough when the strike began. A few ALPA pilots remained with National throughout the entire duration of the strike.

The NAL-ALPA settlement provides that even if all striking pilots have not been returned to flying duty by Jan. 24, they will be recalled automatically to base pay status on that date. Non-union pilots hired by National during the strike will not be used to replace ALPA members returning to work. Instead,

active check pilots of other affiliated airlines will be employed for this purpose.

● **NAL Loses High-Representation** of the strike will be felt by both National and ALPA for a long time. Largely because of the walkout, NAL's operating revenues during the first nine months of 1946 were \$2,477,000 below the same period last year.

The carrier had a \$1,829,364 net loss during the first three quarters of 1946, compared to a \$159,449 deficit in the same 1945 period. Whereas the company's balance sheet showed \$217,300 in earned surplus last Jan. 1, its records showed a deficit of \$1,711,874 nine months later.

ALPA also has felt the strain of the extended walkout. The union's working membership has borne extra movements to support the 150 NAL pilots on strike. Even so, the striking crewmen received considerably less than their normal pay from union benefits. Additional legal fees and maintenance of ground and aerial picketing further contributed to the union's expense incurred during the conflict.

● **Pay Traffic Season Ahead**—On the brighter side, termination of the strike will before the holidays enable National to take full advantage of the peak Florida vacation traffic this winter. And, for many after the walkout ended, CAB again acted to raise the carrier's temporary net pay.

Last March over ALPA protests, the Board boosted National's net compensation by about \$441,000 for the period July 15, 1947, to Dec. 31, 1947. It must thus triple the net effective during 1945 and more than double the rate effects as after Jan. 1, 1949.

● **More Money Offered**—The latest adjustment would increase National's net pay for the period between July 14, 1947, and June 30, 1948 from \$789,000 to \$1,672,000. For the last six months of 1948, National would receive 17 cents more for each gross pay minute of 30 cents and starting Jan. 1, 1949, it would get 17 cents instead of 7.5 cents.

Under the new long-range rate, National would get extraordinary net pay aggregating about \$1,445,000 annually. But the latest adjustment is still much less than compensation NAL for the abnormal losses suffered during the strike. CAB will determine whether the strike losses should be canceled out by and pay in an upcoming and final rate study.

● **Dissemination Inquiry**—Dispute settlement of the walkout: CAB last week held a public hearing continuing on its investigation to determine whether transfer of National's routes to Pan American Airways, Delta Air Lines, Eastern Air Lines and another appropriate carrier would be in the public interest.

flaring in the line between proposed to Jan. 24.

During the pre-arranged conference, National and Delta attorneys and the two carriers are still negotiating with a view to possible merger. But, this, added, the Board's chairman's investigation is hampering the talks.

World Coach Plan Tabled by IATA

Despite strong views, international scheduled airlines have agreed to stick to present passenger and cargo rates until next October.

It is probable they will introduce a transient class rates by then—discount service on a selective scale.

Decisions to hold the line was made at the recent annual conference in Rome of the International Air Transport Association.

The IATA meetings stressed lower rates. The reason was advanced by W. H. G. Laporte, chairman of the joint traffic conference. "The public demand for a cheaper mode of air transport in addition to the present standard of service cannot be ignored."

Unfettered Statement—That view was strengthened by the statement of Sir William Hildes, that "international air travel should be the vehicle of the tourist, hand's holiday."

An important message passed at the conference was standardization of lower rates at \$50 across the North Atlantic and \$40 across the South Atlantic. Skippers were given a year's notice where time \$25 to \$125.

No action was taken on air cargo rates, Laporte said, although "the price at this time, stand as not designed to attract customers."

More Study Needed—While none of the airlines represented at the conference wanted to adopt tourist fare new to the airlines, they agreed to study the matter. The matter was stopped in some cases where it felt that further study of the matter was necessary before making any definite commitments. There is also a desire to observe results of all issues of passenger rates which from time until April provide for a 25 percent discount on tourist rates not exceeding 30 days.

A committee representing Confederation of Air and Two will conduct conferences with Australia, New Zealand and Pacific Islands will meet in March, Jan. 1 to work up a proposal on tourist rates which will be submitted at the next joint conference, Apr. 1. The committee also is to consider the subject of reductions in cargo rates.

Emergency Forecast—Lionel Seligson, chairman of the IATA traffic committee, showed that introduction of tourist rates would not only benefit

Capital Airlines is marketed passengers wait skycoach service after coming into such as the crowd waiting for one of the first planes that ran from LaGuardia Nov. 29.

Public Takes to Skycoach Service

Experimental domestic service is suggested, the Air Transport Association (ATA) and Capital Airlines (PCA) are continuing to pay off in a big way.

Enthusiastic public reception of its low cost air transportation has caused the ATA to add another daily flight in each direction between New York and San Juan, Puerto Rico, on Mondays, Saturdays and Sundays. And Capital has last month begun running extra sections on its coach service between New York, Pittsburgh and Chicago to handle the traffic on-line.

PAA Loads Heavy—Since starting its daily tourist class service to Puerto Rico with special 61-passenger DC-6s last Sept. 14, PAA has had the flight loaded almost solidly in advance. The one-way fare of \$75 compares with the \$125 first class fare.

During the first 47 days of coach service, PAA had 1917 seats available on all flights—2951 throughout and 7961 southbound. Of those 2765 were sold on northbound flights at average of 49.5 per trip, making a 54 percent load factor. Southbound, 2016 seats were

sold, an average of 47 per flight, giving a 65.8 percent northbound load factor.

PCA Makes Profit—Meanwhile, Capital, which estimated it could break even with a 50 percent load factor on its low-fare "Night Hawk" run between New York and Chicago, is averaging 65 percent. On Nov. 25, Capital was forced to provide two extra sections combined and two on these extra sections—four planes each way.

Between Nov. 18 and Nov. 27, some of Capital's southbound coach flights carried less than 25 passengers on the through load from Chicago to New York. In addition, substantial amounts of traffic moved on the Chicago to Pittsburgh and Pittsburgh to New York segments.

Weatherbound between Nov. 18 and Nov. 27, the smallest through load to Chicago was 25 passengers. And on that occasion one passenger made the New York to Pittsburgh trip and in role from Pittsburgh to Chicago.

As of last week, Capital had 510 Night Hawk bookings up to Jan. 1.

the airlines and passengers but would also have a considerable effect on Europe's economy.

"From the day," and Schenck, "the airlines have, indeed, become a new and a certain customers to Europe. In most cases, they spend several months there before returning to America come back with much higher loads. We know again because our mail system with these people is such at the beginning of the summer and in the early fall when the season is over."

"Tourist rates would encourage the

two-to-three-week, one-way trip which he going out coming over a four to five-month period, certainly giving the airlines full passenger loads both ways."

Schenck pointed out that large numbers of these customers would "distribute their money more evenly throughout Europe than do the few wealthy vacationers that go there now." He expressed regret that because of insistence on passage at the tourist fare at this time, the international airlines would not have a full scale domestic operation until 1950.

VICKERS VALETTA

Troop carrier, freighter, ambulance, glider tug or parasporter—the Vickers Valetta lends itself readily to a conversion to any one of these roles.

This versatile plane incorporates all the proved characteristics of the famous Viking. There are two main changes in design—a wide door has been cut in the rear fuselage to facilitate rapid loading and unloading of military equipment, and the floor has been specially strengthened. A cargo hatch below the floor runs the entire length of the fuselage and is easily accessible from the ground. Carrying heavier and more varied loads at a greater speed than is possible with similar transport planes at present in use, the Vickers Valetta will prove itself invaluable in a transport aircraft.

Accommodation is provided for a crew of four. Maximum speed of the Valetta at 14,000 ft. is 235 knots at 1,500 ft. on 4,210 h.p. or 233 knots at 10,000 ft. on 3,910 h.p. The service ceiling on one engine is 5,000 ft. on one rated power at 2,500 ft. using maximum power.

with built-in seats. Special tie-downs are arranged to allow speedy, unobstructed loading and unloading of heavy guns and other equipment. An insect drive is provided for the dropping of paratroops or supplies.

in service with The Vickers Valetta flying off the deck of the aircraft carrier HMS *Queen Elizabeth* in 1945. The aircraft was built by Vickers-Armstrongs Ltd. and was powered by four Bristol Hercules 230 engines each providing 2,000 h.p. at take-off.

VHF COMMUNICATION and LF NAVIGATION SYSTEMS
meet every Operational Need

THE A.R.C. TYPE 11A
Meets basic needs by providing for VHF Transmission, LF Range Reception and Rotatable Radio Navigation.

THE A.R.C. TYPE 12
Combines the advantages of the Type 11A and the Type 17, offering 2-way VHF, together with LF Range Reception and Rotatable Radio Navigation.

THE A.R.C. TYPE 17
A 2-way VHF equipment, including a rotatable VHF Receiver and a 3-channel, crystal controlled VHF Transmitter.

All units of these systems have been Type-Certified by the CAA. For the highest standards of design and manufacturing and the finest in radio equipment, specify A.R.C.

C&S Would Abandon Service to 3 Cities

Taking as unprecedented step to eliminate "concurrent, wasteful and one-company competition," Chicago and Southern Air Lines has sought permission to abandon service to three Illinois cities.

The communities - Bloomington, Springfield and Peoria - were placed on C&S Route 1 by the Civil Aeronautics Board in a "one-third" certificate issued in 1959. But now, Chicago & Southern claims, other transportation facilities between these cities adequately serve the needs of commerce, the Post Office and national defense.

Power Defect - Chicago & Southern's request raises an added significance in view of CAA's recent policy statements. Last July (Aviation Week, Sept. 27), the Board went out of its way to make clear that the Civil Aeronautics Act gives it power to eliminate a point from a certificate if requested by the public interest. CAB in the past has suspended service at excessive points for economic reasons, but has not withdrawn outright abandonment.

Peoria is currently receiving service from C&S. Service to Springfield was withdrawn by the carrier until October, 1960, when it was suspended due to inadequate airport facilities. Although the field has been improved since the end of the war, Chicago & Southern has not reauthorized service to Springfield for economic considerations. Service to Bloomington has never been started by C&S because that city's airport facilities have not been adequate for the type of planes operated by the carrier.

Low Traffic Potential - Is its request for abandonment, Chicago and Southern told CAB that neither present traffic nor reasonably foreseeable public potential is sufficient to justify or support continuation of the company's existing service to Peoria or reauthorization of C&S service to Bloomington or Springfield. The carrier said inauguration of service to Bloomington and Springfield would increase its dependence on government aid indirectly, while abandonment of service to these cities would "tend to improve the economic stability of the C&S system."

Peoria receives service from American Airlines and TWA, besides that offered by Chicago & Southern. In addition, it is slated for service from Delta Air Lines, a trailer not yet activated.

Springfield is being served by American and is also a point on the Delta network. Peoria has been designated to stay in Bloomington.

Opposition Expected - Bitter civil opposition to Chicago & Southern's proposal is in prospect. The carrier must

also obtain permission from the Illinois Commerce Commission to abandon its service. And C&S has rejected other opportunities to cut down road mileage.

Last September, the Board ordered Colonel Anthony to start service to Poughkeepsie, N. Y., despite the carrier's statement that this point would not be self-supporting and already had conflict surface transportation. Colonel pointed out that the prospective annual loss of around \$12,000 in Poughkeepsie would have to be made up through additional revenue on other routes.

Early in 1947, CAB initiated investigations of both Chicago & Southern and Colonial to determine whether their increased dependence on mail pay subsidies was due in part to unreasonable discrimination of their domestic route patterns. The Board also was interested in finding whether operations not yet inaugurated should be postponed indefinitely or suspended for a period of time. But the problem has brought no results to date.

British Discloses Losses

Continued utilization of commercial air aircraft and high operating costs are keeping Great Britain's fleet state under strain for its use.

A government white paper has disclosed that British Overseas Airways Corp., British European Airways and British South American Airways lost a total of about \$44,900,000 during the year ended Mar. 31, against about \$40,100,000 in the previous 12 months. BOAC's deficit dropped from around \$12,500,000 in the year ended Mar. 31, 1957, to about \$28,410,000 last year. But BEA's loss rose from about \$5,400,000 to \$14,130,000, while BSAA's \$12,000 profit for the year ended Mar. 31, 1957, became a \$1,698,000 deficit last year.

The British Ministry of Civil Aviation said that despite reorganization being carried out by BOAC and BEA to effect economies, losses this year will also be substantial.

Cruzair Gets Permit

Issuance of a foreign air carrier permit authorizing Servicio Aereo Cruzair de S.A. to operate between Rio de Janeiro, Brazil, and New York via Boston, Port of Spain, San Juan and Ciudad Trujillo has been announced by CAB Executive R. Vernon Radcliffe.

Cruzair was designated by the Brazilian government to conduct the service in accordance with that country's bilateral air transport agreement with the U. S. The Brazilian permit also is to inaugurate regular flight to the U. S. with DC-4s, two of which now are owned.

CAA Charges Overload In Alaska Nonskid Crash

Colonias Air Corp., nonskid carrier active on the Pacific Northwest-Alaska run for the last two years, has caused operations following a crash on the report CAA administrator at Anchorage, who said suspension of the company's operating certificate.

The complaint charged that Colonias' DC-3 cargo plane which crashed on takeoff from Merrill Field, Anchorage, Oct. 19, was overloaded by 2000 lb. It alleged that the company had given extra weights on its cargo man-

ifests and had operated from fields when weather was not suitable.

In announcing that his company had made its last flight, Joe Dobbin, Colonias president, asserted that CAA had issued the scheduled airlines to drive all nonskid out of business. "What's the use?" he asked. "The cards are marked against you. CAA is policeman, judge and jury."

Dobbin stated that the load had nothing to do with the Anchorage accident. He said CAA inspectors permitted him to carry 6700 lb. at flight if no passengers were aboard his DC-3. "We had only \$800 lb. aboard," he said, "but we had our unexpected pas-

A Break in the Overcast

The economic outlook for air transport has been dismal. It still is. Visibility has been zero. Vague and faint hints of hope are evident. But here and there bits of hope are evident.

► **Two Leaders Converge**—For example, two top executives of the industry made divergent public statements recently which denote convergence.

American Airlines President Ralph Dungan told the New York Society of Security Analysts that there is a good possibility the industry (as emerge from red ink) "in the near future," provided there is no drastic change in economic conditions, and that the airlines continue to monitor a high safety factor.

Earlier than becoming the general drop in all national travel, Mr. Dungan emphasized that the airlines are winning some confidence from earlier losses. He said his travel will decline 3 percent this year. But passengers will decrease 12 percent. Airline passengers will decrease only 3.5 percent.

In Kansas City, TWA Board Chairman Warren Lee Purnell attacked his colleagues, angrily expressed on his return from Europe, that the airlines must stop blaming each other for their difficulties, and set to work cleaning their own house.

Earlier, when American Airlines made such comments about the industry in its editorial, some executives took offense.

These pungent, optimistic statements by men leading two transcontinental airlines present a refreshing contrast to the industry's gloom. We have heard for so long. Perhaps there was the beginning of a new look to improve the public that the airlines are making a game fight to save more people more efficiently instead of belittling the network and themselves so that the industry is so poor it is rapidly deteriorating without more and more government money.

It seems inevitable that these airlines must continue to continue to place all of the blame on others will not remain in control indefinitely. Bold ideas and fresh thinking are indispensable in working on transport out of its difficulties. This is true for CAB. We hope and believe CAB is past the immature stage of drinking collected red wine, weeks ago when it called top airline people together in emergency sessions, and then placed the stress of red wine in high priority.

► **Flowering Lines Faces**—We have already given production space here corresponding both noncommercial and scheduled services diverging strongly to experienced with heavy duty. Commercial aviation can never hope to be a permanent, more transportation medium if it offers only the best service. More than any (passenger) and may help an airline's illusion of grandeur, but they won't keep a line running.

It may be true that fewer Americans are traveling. But it is not as true for sitting down and relaxing or going. A few airlines are stilling out not only to attract a bigger share of the public that is already traveling. They are not to create new traffic that did not even exist before lower fares were offered.

Elsewhere in this issue Charles Adams on Transport

Editor, reports that experimental coach services launched by Pan American and Capital are winning enthusiastic public response. Pan American has added a second coach plane in each direction between New York and Puerto Rico on Fridays, Saturdays and Sundays. And Capital has added coach planes frequently on its New York-Pittsburgh-Chicago run at a fare about \$2.50 more than a normal coach ticket. On Nov. 29 four DC-8's were operated on this service each way.

Special trans-Atlantic excursion fares are also bringing both unexpected traffic already this winter, and operators of International Air Transport Association expect a second class or coach fare schedule will be added next fall.

The amazing thing to us is that since other airlines profess to be debilitated by the volume of passenger loadings so quickly after these low priced services were started. Obviously, coach rates are not the sole answer to industry's survival, and they will be most successful in longer hauls, as the transcontinental non-scheduled lines have shown. But it should be clear to any business man that higher fares will never increase passenger traffic. Empty seats pay no expenses, let alone producing any profit.

This industry has underestimated its own potential. It doesn't know its own strength. If it would get together and make it possible for the airlines to fly as economically as to travel by train, launch a concerted and cooperative efficient campaign plugging its service, and combine its efforts for common, safety, reliability and security, it will be assured of public response. The public's task to support open houses and experimental coach services are burdens of a growing future.

► **Selling the Public**—Speaking of public response, the largest airport open house of them all was held in Los Angeles, Sunday, Nov. 14. Nearly 150,000 people set a new high in the series of such events. American and a few other airlines have sponsored to get the public acquainted with airlines.

The first evening opening at Municipal Airport set up displays and usually for inspection. American conducted "lightning flights" over 10 minutes and carried 750 reserve passengers (or about half the total fare) for the three lines which were offering this service. Western flew 264 persons. "We could have sold at least as far as the number of tickets if we had had the space," Hicks Cowen, American's eastern region public relations manager, said.

The most important fact is that 9 out of every 10 Los Angeles passengers was a first flight. For experience shows that more people are concerned to air travel after their first flight. For too long, we transport has been overestimating its selling on regular air passengers instead of the millions who have never flown.

The sky is still dark, but signs like these point to a break in the overcast.

ANOTHER NEW PRODUCT BY A FABRICATOR USING A DU PONT PLASTIC

FLYING BASIN TRAVELS LIGHT—MADE OF DU PONT "LUCITE"

Saves weight... makes greater payloads possible

IN THE "GALLERY," this 14-1/2 inch, thick "Lucite" basin the last. It's formed by a combination of pressure—forming, vacuum-forming and blow-molding "Lucite" is not affected by either acid or other food acids. It resists most chemicals, withstands wide temperature ranges, and it's easy to maintain. Watch new developments in "Lucite" and other Du Pont plastics in the Plastics Bulletin. Write for your copy.

Soon you may see basins like this—about any way you travel. Features of "Lucite" are excellent wherever dead-load must be kept light—on aircraft, watercraft, trailers and trucks.

Weighing only 1/3 the weight without fittings, this basin of "Lucite" acrylic resin combines beautiful color with durability. The manufacturer's tests show that the basin withstands hot water, has excellent dimensional stability, and is chatter-resistant.

For other applications, "Lucite" is preferred because of its superior resistance, crystal clarity (transmits up to 92% of visible light) and its ability to "pipe" light around corners. Airplane manufacturers are using Du Pont's special "Lucite" for endplates that filter out harmful ultraviolet rays. "Lucite" is readily fabricated or molded in many colors—transparent, translucent and opaque.

How about your aircraft? Perhaps you can profit with economies made from "Lucite" or another Du Pont plastic. Write for more data, E. L. du Pont de Nemours & Co. (Inc.), Plastics Dept., Room 2212, Arlington, N. J.

Basin and fittings made by American Plastic Products, Inc., Millers, New Jersey.

The North American F-86, powered by a General Electric TG-190 (USAF Type J47) turbo-jet engine, is the "blue ribbon" winner of the new official world speed record of 670.981 miles an hour.

Piloted by veteran ace Major Richard L. Johnson, the turbo-jet plane bettered its own unofficial record of 669.75 mph set at the National Air Races at Cleveland. The F-86 was completely armed and carried a full complement of ammunition. The new record was announced on Air Force Day by General Hoyt S. Vandenberg, Chief of Staff of the Air Force.

The TG-190 power plant of the super-streamlined F-86, was developed and produced by G-E's Aircraft Gas Turbine Divisions at Lynn, Mass. The former speed record of 650.796 miles per hour was set by a Navy Douglas D-558 "Skystreak" propelled by the General Electric designed TG-180.

General Electric research and engineering works continuously to improve existing products and to devise new means to assist its associates in the aviation industry. G-E leadership in the development and production of engineered systems and precision products for aircraft is available to you by contacting your nearest G-E office.
